

UP FRONT

Y2K survival

The passing of 1997 marked a milestone of sorts in year 2000 preparedness. Experts say companies that don't already have a plan in place to fix the millennium problem probably won't make it (see stories, page 6).

Surprisingly, an awful lot of companies continue to whittle past the graveyard. Of 108 Fortune 500 IT managers interviewed recently by Rubin Systems, Inc. and Cap Gemini America, 80% said they don't have a full-fledged year 2000 strategy in place. And just as many said they've underestimated the cost of fixing the problem.

Sadly, the window to do that cheaply or easily is now closed. The first companies to get a handle on the year 2000 started around 1996 and expect to beat the deadline by only a year. And if you're still hiring people, good luck. Code programmers can get \$1,500 per day in some places, and that fee may double over the next 18 months.

This week's special report, which begins on page 77, turns to the emerging issue of contingency planning: what to do when you don't make it. We also look at how to avoid a staffing

If you're still hiring people, good luck.

panic and examine some tools that can change your job already made. In particular, I'd call attention to the opinion column by Ed Yourdon, who joins us as a monthly columnist this week. Yourdon suggests that IT organizations declare a moratorium on new development until they get the year 2000 problem fixed. There's fighting words for IT leaders who would rather think of themselves as partners in business re-engineering than code fiends. But it's also good common sense.

The year 2000 problem... like a mouse, focuses the mind. Organizations that had the foresight to tackle the problem two years ago are now enjoying the luxury of being able to proceed with more strategic matters. Those who waited are entering crisis mode. A lot of new development is going to get put on hold this year, whether we like it or not.

Cabletron rethinks 'unrealistic' pricing

► Reorganization spurs reassessment; E-commerce site eyed

By Bob Wallace

CHEAPER PRICING may be on tap for Cabletron customers.

In the wake of a reorganization, which will be detailed this week, New CEO Don Reed said the Rochester, N.H., switch maker is rethinking its pricing structure and gearing up to launch an electronic-commerce site.

"Our list pricing is unrealistic. [so] we're re-evaluating our entire pricing system," Reed acknowledged in an exclusive interview with Computerworld last week. "The reason we're doing this is we're running into more price-competitive bids."

The pricing re-evaluation will be completed in the next three weeks, Reed said. He didn't provide additional details.

WELCOME NEWS

The reassessment is welcome news to analysts and customers of Cabletron Systems, Inc., who said the company's list prices are as much as 50% higher than those of rivals Cisco Systems, Inc., 3Com Corp. and Bay Networks, Inc.

"You need to get 30% discounts to get the pricing close to where it should be," said Edward Bianco, chief information officer at Lowell General Hospital in Lowell, Mass. "You waste a lot of time negotiating 'discounts,' and it's a real pain for their salespeople. We should only have to go back and forth once or twice."

"Cabletron comes in at 20% to 30% above the rest of the world on list prices," said John Morency, an analyst at Renaissance Worldwide, Inc., a Newton, Mass., consultancy. "Given that all the big players offer similar discounts, Cabletron keeps coming out on the high side."

CONTRACTS AFFECTED

The high list prices concern some Cabletron users.

One user said the high list prices have a negative effect on service contracts, which he said are based on a percentage of

E-commerce move applauded

On the customer support front, Cabletron CEO Don Reed said the company is testing an electronic-commerce site that will enable users to buy, get pricing and submit configurations for the vendor's products online.

"The goal is to make it easier to do business with Cabletron," Reed said.

Ron Rimmer said the electronic-commerce system is a good move for Cabletron.

"This should streamline some processes and facilitate cost control," said Rimmer, network manager at Wake Forest University in Winston-Salem, N.C. "Anything that reduces paperwork would greatly benefit us. It sounds like a big plus."

As part of the company's reorganization to be announced this week, Cabletron will create a business unit to develop and sell products to telephone companies and Internet service providers.

And Chris Oliver, director of engineering, has been promoted to chief technology officer.

— Bob Wallace

"Anything that reduces paperwork would greatly benefit us"

the list price paid for equipment.

"It makes it hard and expensive to do service contracts," said Marc Sayer, a network systems engineer at Heidelberg Harris, Inc., a printing press maker in Dover, N.H. "Since we have limited dollars for service contracts, it can force me to take products off these contracts. I have to decide whether or not we can afford a device to go down."

List prices for Cabletron products are 15% to 25% higher than their main competitors, he said.

Not surprisingly, analysts said high equipment list prices have kept Cabletron from winning accounts as price competition

becomes fierce.

Cabletron ranked a close third in sales of Ethernet switching last year, with 12% of the \$4.8 billion market, according to the Dell'Oro Group, a Portola Valley, Calif., research firm. Cisco led the Big Four with 37%, followed by 3Com with 16%.

"It has locked them out of some business, more lately than in the past," said Craig Johnson, an analyst at Dataquest in San Jose, Calif. "If a vendor starts with high list prices, they have one strike against them with users, who want list prices to be very competitive." □

Digital to launch NT-only Alphas

► Lower prices target resistant users

By Jaskumar Vijayan

DIGITAL EQUIPMENT CORP. is developing a line of Alpha-based Windows NT servers that for the first time will offer near price parity with Intel Corp.-based systems.

The idea is to lure more users to Digital's Alpha microprocessor platform by removing the entry-price barrier that has kept it but the most performance-conscious users out of the Alpha fold.

Alpha products previously cost 20% to 30% more than comparably configured Intel systems.

Digital's newest servers, which are slated to be announced next week, will feature a slightly tweaked version of the Alpha chip, modified to run only on Windows NT, said Terry Shannon, editor of "Shannon Knows DEC," a newsletter in Ashland, Mass.

Alpha firmware, required to boot OpenVMS and Digital Unix, is being removed from

the latest version of the chip as part of Digital's attempt to position it as a Windows NT-only product, Shannon said.

MORE POWER

Digital's Alpha-based NT systems offer significantly more raw performance than Intel-based servers.

By lowering prices, Digital hopes to attract more performance-hungry users who have stayed away from Alpha because of the price, said Joseph Fenzl, an analyst at Technology Business Research, Inc., in Hampton, N.H.

This is the first time Digital has tweaked an Alpha chip to exclude the OpenVMS and Digital Unix operating systems.

Digital's moves come at a time when it is struggling to grow Alpha product revenue. In its latest quarter ended Dec. 27, Alpha server revenue grew by a mere 2% over the same period the previous year, while workstation revenue dipped by 27%. □

3Com smashes switch price barrier

By Bob Wallace

3COM CORP. this week will announce aggressively priced Gigabit Ethernet switches designed to make the new high-bandwidth technology more af-

fordable for implementation in corporate data networks.

Two new switches will shatter the industry's \$2,000-per-port price ceiling for Gigabit Ethernet-only switches by as much as 37%, said analysts briefed by 3Com. The company's SuperStack 9300 family comprises two models: a 10-port Gigabit Ethernet switch at \$1,575 per port and a 12-port system at \$1,249 per port, sources said.

"The Gigabit Ethernet switch pricing will make it much easier for users to justify adding the technology to their networks," said one of the analysts briefed, who requested anonymity. "It makes 3Com the first of the Big Four to announce a low-cost al-

Gigabit switch."

The Santa Clara, Calif., networking company is expected to fuel wider deployment of Ethernet switching to the desktop with the SuperStack 1100, which has 24 ports at \$77 per port. It has two 100M bit/sec. uplinks. That is the lowest price per port of the top four switch makers, analysts said.

3Com will keep pace with Cisco Systems, Inc. on the 10M/100M bit/sec. switch front with the SuperStack 3300, a 24-port unit priced at \$175 per port, and the SuperStack 3900, which can support up to 36 ports and costs \$245 per port. The 3900 can be equipped with a \$1,995 Gigabit Ethernet uplink. □

Microsoft/Digital pact takes shape

► Move will expand NT, Alpha features

By Laura DiDio and Jaskumar Vijayan

LATER this month, Microsoft Corp. and longtime ally Digital Equipment Corp. are expected to announce more details on their efforts to port a 64-bit version of Windows NT to Digital's Alpha platforms.

The moves are part of an expansion of Digital and Microsoft's ongoing Alliance for Enterprise Computing initiative, which was launched in August 1995. They give Microsoft another shot at leveling the playing field between Windows NT servers and the more powerful high-end Unix machines.

CLOSER TIES

Microsoft and Digital last week confirmed that they will expand their relationship but didn't elaborate.

The announcement reportedly will focus on delivering new performance clustering and high-availability technologies on Digital's Windows NT server product lines.

Microsoft and Digital also are expected to announce plans for integrating support for Very Large Memory and Very Large Database technologies on 64-bit Alpha-based Windows NT servers.

Digital also is working on fortifying its Windows NT offerings with enterprise-oriented World Wide Web applications that borrow heavily from

OpenVMS technology according to the latest edition of "Shannon Knows DEC," a newsletter in Ashland, Mass.

ONLY THE BEGINNING

Noting that Microsoft has pushed back delivery of Windows NT 5.0 until at least year's end, Jon Olisak, an analyst at Forrester Research, Inc., in Cambridge, Mass., said he expects that the forthcoming Digital/Microsoft announcement will be the first of many such events initiated to market Windows NT as an enterprise operating system. □

Microsoft and Digital will expand their current alliance and deliver:

- A version of Windows NT that runs on Digital's 64-bit Alpha machines
- New performance clustering and high availability
- Integrated support for Very Large Memory and Very Large Databases

Judge keeps special master

By Carol Sivas

FEDERAL JUDGE Thomas Penfield Jackson last week abruptly rejected Microsoft Corp.'s motion to remove the special master he appointed to issue findings in the case. He also interjected several pointed questions to Microsoft representatives at a hearing in Washington.

At issue was the judge's preliminary injunction ordering the company to "cease and desist" licensing its Windows operating system on the condition that "the licensee also license

and pre-install" Microsoft's Internet browser.

"[It seemed] absolutely clear that I entered an order that you should distribute a product that wouldn't work. Is that what you're telling me?" Jackson asked Microsoft Vice President David Cole.

"In plain English, yes," Cole answered. He said the company followed the orders.

Microsoft and the Justice Department must file briefs that summarize the facts of the case and are due in court Thursday for closing arguments. □

Microsoft bundling hits Netscape Web servers

► Battleground changes; tactics remain the same

By Carol Shaw

MICROSOFT CORP. has been attacking rival Netscape Communications Corp. on the Web server front with the same bundling tactics that worked with its Internet browser.

Just as it bundles Internet Explorer with Windows 95, Microsoft is bundling Internet Information Server (IIS) with Windows NT. Netscape sells its browser and server as stand-alone products.

Netscape officials blamed the company's expected fourth-quarter loss on declining browser revenue, and CEO Jim Barksdale has argued that Microsoft puts more financial pressure on his company by giving away its World Wide Web browser. But the company is under siege in the Web server market, too.

Because Netscape doesn't break out server revenue by individual types, it is difficult to gauge the financial impact of Microsoft's strategy.

But according to a poll of 1.8 million Internet accessible servers by Netcraft Ltd., a U.K.-based network consultancy, Microsoft has overtaken Netscape as the leading commercial vendor of Web servers.

Two years ago, Netscape dominated that area, but the latest results show Microsoft with a 21.7% market share and Netscape with 10.5%. Netscape officials pointed out that the company's major focus is intranets and complained that the Netcraft survey can't poll intranet Web servers that sit behind company firewalls.

The Mountain View, Calif., software maker pointed to two other surveys conducted by industry consultancies that show that it still leads the combined Internet/intranet Web server market apiece. Netscape also argues that its server has advantages over Microsoft's. "Most corporate buyers need more sophisticated products than just the bundled IIS. That's actually not a very scalable product," Barksdale said.

But Microsoft clearly has been making inroads at the low end of the market with users of its operating system software.

NASA/Marshall Space Flight Center in Huntsville, Ala., is an early adopter of Microsoft products, so it was natural for users to test and then use IIS.

"We threw it out there because we had it and it worked," said J. Briscoe Stephens, advanced scientific information systems coordinator at the center. He said he also likes the benefits of tight integration.

Stan Lepeak, an analyst at Meta Group, Inc., in Stamford,

Conn., said, "Microsoft has made entry level very appealing from a cost standpoint. I don't think Netscape can compete at the low end of the market."

Netscape hasn't been oblivious to the need to broaden its

"We threw (the IIS) out there because we had it and it worked."

J. Briscoe Stephens
NASA

offerings and has added a variety of new enterprise-oriented server offerings, including directory, messaging and collaboration. But company officials said the groupware/messaging market has been tough.

Still, Netscape "should remain a strong competitor." "Netscape's brand and visibility with MIS shops is even bigger than the company itself. They aren't going to go away overnight or anytime soon," said Jamie Kiggen at Cowen & Co., a financial consultancy in Boston.

Heather Ashton, an analyst at Hurwitz Group, Inc., in Framingham, Mass., agreed: "Netscape has done a pretty good job of making some pretty large enterprise sales, despite Microsoft being there with NT." □

✶ Netscape can't win on two fronts against Microsoft, David Moschetti argues. Page 117

SIA: Millennium backup planning lags

► Agency commits to devising preventive strategy

By Thomas Hoffman
New York

YEAR 2000 experts say Wall Street is, in many ways, at the forefront of dealing with the so-called millennium bug.

But securities industry executives acknowledge they have barely begun to devise backup plans in case their year 2000 firms don't work (see related stories, pages 1 and 77).

The securities industry is just starting to assemble fallback plans in the event that highly interactive interfaces and systems among brokerages, stock exchanges and clearinghouses should fail, said Charles Costa, chairman of the Securities Industry Association (SIA) year 2000 conference held here last week.

Because of the complex data links and settlement requirements, disaster planning will be particularly vexing for the financial services industry.

The sector "is one of the most code-dependent industries in the world," said Irving Weiser, chairman of the SIA in New York, and chairman and CEO of Dunn Rauscher, in Minneapolis.

The potential for disaster in the securities industry is frightening. For example, the date-related failure of a small clearinghouse that settles as little as 3% of the foreign exchange market could lead to \$5.2 billion in total market costs, ac-

SIA's Charles Costa: The securities group is starting to form a subcommittee to consider different year 2000 disaster scenarios

ording to research by Computer Sciences Corp. in El Segundo, Calif.

Costa, who is also the year 2000 program director at J. P.

Morgan Securities, Inc. in New York, said the SIA is just starting to form a subcommittee whose charter will be to dream up different disaster scenarios that could affect industry players, from investment bankers to stock exchanges.

CONTINGENCIES

Another SIA subcommittee is coordinating industrywide system testing and will select a member company this week to act as a testing coordinator for the industry.

The selected company will devise what-if scenarios and create an action plan "in case the New York Stock Exchange goes down," for example, said Dawn Lowell, senior vice president at Lehman Brothers, Inc. and a subcommittee member.

The SIA also expects to decide this week whether to lobby the federal government to make Friday, Dec. 31, 1999 — and possibly Jan. 3 and Jan. 4, 2000 — "security trading holidays" to give firms some breathing room, Weiser said.

If SIA goes in that direction, the Federal Reserve Board "should get behind it," said Wil-

BUILDING A BACKUP PLAN

Tips from year 2000 guru Bill Ulrich

Identify events — by business unit — that may adversely affect business functions

List failure scenarios that may affect a system or third-party linked to those functions

Assess damage that these events could cause as failure dates come and go

Rank events from most catastrophic to least, based on financial, legal or regulatory risks

Examine odds of each high-impact event occurring and rank most probable to least probable

Eliminate low-probability/low-impact events from the list

Source: Tachar Strategy Group, Inc., California

liam J. McDonough, president and CEO of the Federal Reserve Bank of New York.

Year 2000 consultants said securities firms should examine their business processes and identify workarounds in advance in case those processes fail.

For example, if a computer system used for taking customer stock orders goes down, the

brokerage should determine if it can switch to a paper form, said Thomas P. McAndrew, managing director of Computer Sciences' year 2000 national practice in Lexington, Mass.

Whatever the scenario, industry officials agreed they had better get cracking.

"We manage the lifetime savings of clients. This is a do-or-die issue," Weiser said. □

Consultant encourages year 2000 snitching

► Project collects tipoffs on date-change slackers

By Thomas Hoffman

SNITCHING ON year 2000 slacks may be one way to force the nation's businesses and service providers to take the date-change issue seriously, but critics caution that the idea has its drawbacks.

Peter de Jaeger, a prominent year 2000 consultant, has launched a service designed to let tipsters anonymously blow the whistle on companies that are ignoring year 2000 problems.

The service notifies the companies in question and maintains the data, which will be later made available if a court case results from an informed company's decision to not act upon the millennium threat (see related story at right).

The nonprofit service, Project Damocles, isn't intended to publicly expose year 2000 laggards, according to de Jaeger, but rather

to notify a company's legal department that the firm might be exposing itself to a potentially serious problem.

"Damocles succeeds if not a single lawsuit can be pressed in the year 2000," de Jaeger said.

SMALL PROBLEM

Millennium gurus said the Canadian consultants' intentions are honorable, but the service is flawed.

For example, there is no way to filter out disgruntled employees who "could fog up the network with accusations that may not be true or accurate," said Lou Marocco, an analyst at Gartner Group, Inc. in Stamford, Conn.

In those situations, some companies could end up wasting valuable time chasing down dead-end leads, said Joe Boswin, founder of The Global Millennium Foundation, a nonprofit millennium program office for

Canadian businesses and government agencies in Ottawa.

"The process doesn't leave a whole lot of room for verification," said Boswin, who left his post last month as the year 2000 program director at Canadian Imperial Bank of Commerce in Toronto.

De Jaeger acknowledged these issues, but he said the flip side is that companies will be able to snuff out unfounded rumors about their products or services that might otherwise erode customer confidence.

Others were more upbeat.

"I think it's great. If there's a bug somewhere, the sooner I know about it, the better," said Steven McManus, communications manager for the millen-

nium project team at Bank Boston, in Boston.

De Jaeger said he decided to launch Project Damocles after wrestling with the several "dark secrets people tell me about their company's"

year 2000 problems — secrets, he said, that if left unattended, could lead to loss of life.

These include heart-monitoring equipment used in hospitals that could fail if year 2000 compliance is not corrected, and a process controller in a chemical factory that could shut down a valve and cause an explosion.

"It's not that I'm legally responsible, but I'd feel weird if something unfortunate happened," said de Jaeger, who works out of Brampton, Ont. □

Peter de Jaeger hopes Project Damocles will force laggard companies to take the millennium threat seriously

Project Damocles

Here's how de Jaeger's service will work:

— If someone has firsthand knowledge of a system that has failed or is expected to fail, and the system manufacturer or employer refuses to fix it or address it publicly, then the whistle-blower should E-mail that information to year2000.com/pjdamocles.html.

— Information submitted to Damocles will be sent to that company's legal department (with the submitter's name withheld) via registered mail. A copy will be kept by de Jaeger's attorney.

— Should the reports turn out to be true — and inaction by the offending company leads to year 2000-related problems and lawsuits — then a copy of the report will be released to lawyers as part of the discovery process. — Thomas Hoffman

If computing costs

are burdening

your company,

we'd like to offer you

a life jacket.

Introducing Network Computing from Oracle.

Inefficiency, incompatibility and out-of-control

computing costs are sinking too many companies.

The time has come for network computing. In this

friendly, low-maintenance computing architecture,

the information and applications that used to be on

your desktop are now contained on a professionally

managed network. And with your computing so well

managed and precisely controlled, everyone is upgraded

and updated instantly. Leaving you the opportunity

to respond rapidly and intelligently to change.

To implement new business procedures once, over the

network. To expand your reach into markets and

distribution channels you never had the time to consider

before. In fact, the time and money spent owning

and managing network computing is a fraction of the

cost of a desktop computing environment. You can

use your existing hardware and software now and add

significantly less expensive network computing

hardware as you need it. And you can look forward to

a 39% reduction in computer costs, across the board.

It's time to enjoy computing the way it was meant

to be—easy, accessible, powerful, inexpensive.

And full speed ahead.

ORACLE®
Enabling the Information Age®

FRANKLY SPEAKING

ITAA 'Blue' it

FRANK HAYES

Teenagers think IS people are geeks. (Some surprise, huh?) And according to educators, that trendy image is scaring students away from high-tech careers [CW Jan. 12].

Unfortunately, government and high-tech industry leaders seem to be in a tug-of-war to prove that these teenagers are absolutely right.

Consider the bizarre case of the Jimmy Smits video.

As part of a new campaign to help fill hundreds of thousands of empty seats in IS shops, the White House and the Information Technology Association of America announced last week that thousands of copies of a video starring television actor Jimmy Smits will be distributed to high schools and colleges.

The video, which was produced by Microsoft, was designed to glamorize

computer-related jobs. "It's going to show that it's a hip line of work," says ITAA President Hanna Miller.

Hip? Hip??

Valuable and important? Sure. Fun and exciting? Sometimes. But let's face it: Nobody but nobody is stupid enough to think IT is hip, glamorous or cool because of a Jimmy

The video is a clueless stunt by a bunch of geeks trying to look hip.

Smits video. Least of all high school and college students.

Smits isn't a programmer; he's an actor. A good one, to be sure. But these kids aren't about to be sucked into the

idea that a computer science education is hip just because a TV star says so. Heck, Smits doesn't even play a programmer on TV. He plays a cop on "NYPD Blue" and used to play a lawyer on "L.A. Law." Both those jobs sound a lot more exciting to most kids than writing software or running networks.

What's worse, any kid who checks out how much respect high-tech people get in the real world will discover what we all learned long ago: Most business people think techies are clueless geeks who serve as little more than highly paid computer mechanics and network janitors. Glamorous these jobs aren't. In other words, the video is a halsome—a dumb, clueless stunt by a bunch of geeks trying to look hip.

And the really sad thing is that the ITAA and the White House believe the stunt is the only way to get students to consider high-tech careers.

What's the alternative? How about putting together an army of real techies to talk up technology to students?

Most IS people, contract programmers and consultants aren't hopeless dweebs. They're regular people who like

their jobs and are proud of their work. They play in rock bands, go skiing, watch sitcoms and party with friends. In short, they're the best examples technology could have, and they're exactly the people who should be spending time with kids who are thinking about what to do with their lives.

Want to do your bit to ease the IT labor squeeze and improve the image of IS people at the same time? Forget about the ITAA and its sham glam videos. Scan the ranks of your young IS employees. Pick out the best talkers. Then send them off to pitch high-tech careers to college and high school and even grade school classes.

You won't get results fast enough to solve your short-term labor shortages. It takes time for high school kids to turn into computer-science grads. But you'll get the wheels turning to keep those shortages from getting a lot worse.

Besides, if you wait for Jimmy Smits videos to deliver the people you need, you could be waiting a long time. And if you wait for someone else to convince the world that IS people aren't, you'll be waiting much, much longer. □

Hayes is Computerworld's West Coast bureau chief. His Internet address is frank_hayes@cw.com.

SHORTS

More delays for Domino, Notes

Sources at Lotus Development Corp., in Cambridge, Mass., last week confirmed that the company will further delay delivery of its Notes and Domino 5.0 upgrades. The new client and server versions have already been pushed back from early this year to midyear. At the end of this month, when the company officially announces the products at Lotusphere [CW Jan. 12], it will tell customers not to expect them until the later part of the third quarter.

Ready, SET, purchase

NationsBank Corp. completed what is believed to be the first U.S. bank test of the Secure Electronic Transaction 1.0 (SET) protocol when a vice president purchased a \$3.95 calculator from a MasterCard site earlier this month. Employees of the Charlotte, N.C., bank will continue testing SET, which is aimed at making internet transactions more secure. Bank officials later this year expect to offer wallet software and digital certificate services to customers using SET.

Sun posts profit gains

Sun Microsystems, Inc. recorded quarterly gross profit of \$223.2 million, a 25% increase from the same period a year earlier, on revenue of \$2.45 billion for the quarter ended Dec. 28. Revenue was up 18% over the \$2.08 billion reported for the same period the previous year. Sun took a onetime charge of \$110.1 million related to its acquisition of Encore Computer Corp.'s storage business.

Unisys takes \$1.1B charge

A onetime charge of \$1.1 billion against earnings

caused Unisys Corp. to report a loss of \$89.6 million on revenue of \$1.9 billion for the quarter ended Dec. 31. Unisys made a profit of \$43.6 million on revenue of \$1.8 billion in the same period a year earlier. Unisys said the charge included a write-off of \$88.4 million related to the 1986 merger of Burroughs and Sperry, and a \$172 million charge related to its exit from the PC business.

Pieper leaving Compaq

Six months after he helped engineer the merger of Tandem Computer Corp. and Compaq Computer Corp., former Tandem CEO Ruel Pieper said last week he is quitting as a Compaq senior vice president. After the June merger, Pieper's role was to help integrate the companies' technologies, which include Tandem's fault-tolerant servers and Compaq's desktops and PC servers, and to direct the companies' combined sales forces.

Microsoft IE bundle scrutinized

The Japanese Fair Trade Commission is probing Microsoft's bundling of its Internet Explorer Web browser with its Windows 95 operating system. Japanese officials also are looking into a Microsoft package offered to PC makers in Japan that bundles a word processor and a spreadsheet program.

Sailor: Navy asked, AOL told

A sailor has sued the U.S. Navy over a discharge he

said was sparked by personal information about him handed over by America Online, Inc., in Dulles, Va. The lawsuit accuses the Navy of illegally obtaining information linking the sailor, Senior Chief Petty Officer Timothy R. McVeigh (no relation to the convicted Oklahoma City bomber) to an AOL screen name that listed his marital status as "gay." The discharge has been delayed until a hearing Wednesday in a U.S. District Court.

Groundhog Day for IT pros

The Department of Education has set aside Feb. 2 as "National Shadow Day," when students and other young people will follow information technology workers on the job to learn first-hand what it is like to be a programmer, systems analyst or IT project manager. Announced at last week's National IT Workforce Convention in Berkeley, Calif., Shadow Day aims to replace young people's image of IT professionals as nerdy with a more realistic idea of the IT profession.

Special offer on NDS for NT

Novell, Inc., in Provo, Utah, last week initiated a special 25% discount from now through the end of April for its newly released Novell Directory Service (NDS) for NT software package. NDS for NT provides businesses with interoperability for their Intranet/Intranet and Windows NT networks by letting Windows NT users be managed via the NDS tree, according to company officials.

SHORT TAKES Microsoft said it will provide NT 3.51 and NT 4.0 with the same set of utilities including file migration and directories utilities, to help users migrate to Windows NT 5.0.

ERP users find competitive advantages

By Randy Watson

AT A TIME WHEN "everybody's doing ERP," users say they can still gain a competitive business advantage from implementing mammoth, "vanilla" enterprise resource planning (ERP) systems such as SAP AG's R/3.

ERP users can gain competitive advantage from the way they implement the systems and exploit the resulting data. Also, users say the systems can make them more nimble in the marketplace than companies with hard-to-change custom programs.

ERP systems are business tools, said Jim Shepherd, an analyst at Advanced Manufacturing Research, Inc., in Boston. "They are tremendously advantageous in the hands of someone who knows what to do with them, but they can be dangerous in the hands of someone who doesn't."

Users find that the biggest gain from ERP packages is that they force a company to institute a proven set of business processes, rather than reinvent the wheel. "One of the big advantages of packaged applications is that as the state of the art moves, you move with it," said Martin Ritchie, director of the ERP competence center at Boeing Commercial Airplane Group, in Seattle.

Deere & Co.'s Bob Townner: Simply having the ERP systems is a competitive advantage

Ritchie said that with a packaged application, users can concentrate on the business at hand, such as making 777s. Meanwhile, the company's software vendor — The Baan Co. in Boeing's case — keeps the user outfitted with the latest technology.

ERP systems also allow users to turn on and off functionality as needed to adapt quickly to changes in their business, where a customized application has to be rebuilt.

"What these applications do is capture data about historical activity, current operations and future plans, and organize that in a way people can use," Shepherd said.

GATX Capital Corp. went live Jan. 1 with German vendor SAP's R/3. A lessor of commercial aircraft and other large equipment, GATX had to customize R/3 to fit its business. Now the San Francisco company is preparing to sell its work to its competition [CW, Jan. 5].

But GATX officials said they aren't worried about selling the secrets of their success. "We make money managing assets and doing good leasing transactions. There is not much coming out of any software system that does that for us,"

said Michael Cromar, chief financial officer at GATX.

Bob Townner, SAP project manager for financial systems at Deere & Co., in Moline, Ill., said that simply having the systems is a competitive advantage because it gives a company a foundation

to run its business and then concentrate on grabbing market share.

Townner said R/3 allows a global company such as Deere to standardize the business processes in its far-flung operations. The firm then can move nimbly and adapt quickly to market demands.

"When you look at the flexibility in big ERP systems, once implemented, they can look entirely different from one organization to another," Townner said. SAP is "a set of building blocks, and it's how you put these building blocks together that gives you an advantage." □

Companies find that backbone ERP systems affect all other technical, software decisions. Page 24

Non-disruptive Instant Point in Time Storage Backup

EMC TIMEFINDER™ AND FDR™ INSTANTBACKUP™ WORKING TOGETHER...

EMC TimeFinder BCV option allows you to create exact duplicates of your existing DASD volumes. FDR InstantBackup allows you to back up the BCV volume, which contains an image of the primary volume that was frozen at any point in time that you choose. Backup of the split BCV volume will take place while the original disk volume remains on-line, available for normal use and update.

WITHOUT FDR INSTANTBACKUP

- Split BCV from Primary Volume A
- Relabel OFF-line B/V of Volume
- Vary Relabel Volume B/V
- Backup Volume B
- During Restore, Set Must B/V

That Backup of Volume B

Really Volume A

WITH FDR INSTANTBACKUP

- Split BCV from Primary Volume A
- NOT REQUIRED
- NOT REQUIRED
- Backup Volume A, the BCV Volume
- No Special Restore Considerations

Relabeling volumes is an administrative nightmare. It may be difficult to identify the backup of relabeled BCV Volume B as a backup of Volume A. While Volume B is online, having a VVDS with a name that does not match the volume serial may cause problems with SMS and VSAM, and reporting and capacity analysis tools will report that data sets on the BCV volumes are uncataloged.

NON-DISRUPTIVE FULL-VOLUME BACKUP

Example of how to perform a non-disruptive full-volume backup:

```

//DSN      EXEC PGM=FB,REGION=0M
//DISK1    DD DSN=FB.00E.UNIT01FB, ← Tells FDR to backup entire BCV
//          UNIT=3390,VOL=SER=RV5007,DISP=OLD      rather than the primary volume.
//          DUMP TYPE=FB
  
```

During this FDR backup of the BCV volume data sets can be allocated, scratched or go into extents on the primary volume without any effect on the backup of the BCV volume!

Call now for a FREE
90-Day No-Obligation Trial!

Crypto bill could see spring passage

By Laura DiDio
SAN FRANCISCO

THE SPONSORS OF A BILL that would ease restrictions on the export of encryption software told users and analysts at

last week's RSA Security show that enactment should occur this spring.

Reps. Bob Goodlatte (R-Va.) and John Ashcroft (R-Mo.) participated in the show's keynote speech via satellite and said the Security and Freedom Through

Encryption (SAFE) bill stands a good chance of passage.

The software industry is punning its hopes on the SAFE bill, which would lift the current 40-bit limit on encrypted data. The issue has taken on more impor-

ance with the rise of the Internet and electronic commerce.

If the 40-bit encryption controls are allowed to stand, American businesses will be put at a terrible disadvantage," said Chris Byrnes, a vice president at Meta Group, Inc. in Reston, Va.

Leading the charge against the SAFE bill is Federal Bureau of Investigation Director Louis Freeh, who advocates strong controls on encryption exports to protect the U.S. from cyberterrorist attacks.

Government regulations currently prohibit U.S. companies from using the latest 128-bit key encryption to secure their data. Organizations must instead settle for 40-bit key encryption, which was "state-of-the-art five years ago but is easily cracked by today's hackers, users said.

"The government's stance against 128-bit encryption is way behind the times. Businesses need adequate protection for their data as well as their customers' data, and 40-bit encryption keys don't do the job anymore," said Abby MacLean, technology manager at Federal Information Exchange, Inc., a government subcontractor in Gaithersburg, Md.

TOO RISKY

"There are serious implications if our customers' transactions were to become public because our encryption key was cracked. It's a risk that we don't want to take," said Ed Elhrgott, director of internal auditing at Charles Schwab & Co., in San Francisco.

A security manager at a large Midwestern insurance agency, who requested anonymity, agreed. He noted that during a demonstration at last year's RSA show, it took a hacker only about three and a half hours to crack a 40-bit encryption key.

"What are we supposed to tell our customers: 'Your information is sort of or maybe safe with us'?" the manager said.

Jerry Berman, director of the Center for Democracy and Technology, in Washington, agreed. He said that if corporations can't guarantee privacy, they will have problems with their customers. "The damage to customer confidence and the bottom line to U.S. businesses could be immeasurable. At this point, we can't even quantify it," Berman said.

To sidestep the current U.S. export controls on encryption, several companies, such as Security Dynamics Technologies, Inc. in Bedford, Mass., and its subsidiary, RSA Data Security, Inc., in Redwood City, Calif., have established Japanese subsidiaries. Japanese companies aren't bound by the U.S. encryption export controls.

But not everyone believes the situation is so dire. "The encryption debate is a really tough, gray issue. Before jumping to any conclusions or snap judgments, we must know specifically what encryption controls will go through," said Dorothy Denning, a professor at Georgetown University's Department of Computer Science in Washington. "Any control will have an impact, but you have to know what the controls are first." □

Year 2000 Project Directors

Test your Y2K data, no matter what

Even if you don't remediate — know what's going to happen

What are your CEO & stockholders asking about your Y2K status?

Uncover hidden data problems that could cost people their jobs. Test your Y2K data in the turmoil of time — right now, long before major headaches. CADAS is the data aging tool that drives an immediate solution. You may not have a problem — but you have to test to find out. When millions are at risk, predict the future confidently with CADAS.

CADAS turns a complex and time-consuming process into a simple and manageable one. The Year 2000 crisis should boost your career — not the opposite. Don't invest a nickel in Y2K data testing until you look at CADAS software. You need results (and peace of mind) now, not later. Testing is the most time consuming part of Y2K projects. Skimping testing disguises future turmoil.

CADAS makes date adjustments a snap, forward or backward, in all stages of data testing.

- Complete stand-alone testing solution
- It's database independent
- Immediate delivery
- Customization available

Know which of your applications are Year 2000 compliant and if not, why not. CADAS gives you a secure grip on Year 2000 data right now. It is the only solution that meets every criteria in data time travel. Calendar and business rules remain undisturbed and firmly linked in the future. CADAS has been proven for 7 years by several international corporations' millennium projects.

Keep time on your side — call us today for details or visit our web site

The only solution that maintains business integrity of your test data

Puzzled???

Platform 2000 Provides All the Pieces to Solve Your Millennium Problem.

RCG IT/QUINTIC — END-TO-END YEAR 2000 SOLUTIONS

Platform 2000™ is a comprehensive offering that includes a methodology, software, and services. This approach allows RCG IT/Quintic to provide the most flexible and robust multi-platform date compliance solutions for your IBM mainframe, AS/400 and Tandem environments. RCG IT/Quintic will license or lease its products and/or provide complete conversion services to piece together a solution tailored to your needs.

PLATFORM 2000™ SERVICES

Platform 2000™ services include complete lifecycle support provided by an experienced, dedicated team of year 2000 professionals. The client may choose any combination of services including: Enterprise Inventory/Scoping, Software/Data Assessment, Conversion Planning, Transformation/Automated Remediation, Testing, Implementation/Integration, and Migration/Production Support. Platform 2000™ support services also include consultation, custom documentation, project management, facilities management, hotline, and the RCG IT/Quintic Y2K University On-site/off-site/offshore conversion capabilities are available to suit your requirements.

PLATFORM 2000™ SOFTWARE

Century Conversion Software addresses COBOL and Assembler in the IBM MVS and VSE mainframe environments, COBOL and RPG on the IBM AS/400 platform, and COBOL and TAL on the Tandem platform. In addition, Century Conversion Software provides a Language Independent Analyzer that locates date usage regardless of program language (e.g. Focus, SAS, C/C++, Esprit, etc.). The system is comprised of three products that may be purchased or leased: Century Source Conversion, Century File Conversion, and Quintic PLUS with Automated Remediation. In addition, a free 30-day software trial is available upon request.

Century Source Conversion Software is an inventory and analysis product that automates the analysis of source code to identify potential date processing problem areas and provides numerous report capabilities which also support general maintenance functions. Primary features include a Dynamic Date Name Dictionary, Extensive Reporting, Inventory/Tracking, a Comprehensive Repository, Complete Parsing Capability, and Time/Cost Estimating.

Century File Conversion Software is a file product that automates the conversion of any database or file which can be produced in a sequential format. Extensive features include File Inventory, Data Analyzer, File Usage Reports, Multiple Date Formats, Automatic Date Reformating, Multiple Record Formats, and Data Regression (last-forward) Testing.

PLATFORM 2000™ METHODOLOGY

Your company may choose any combination of the following services to address each phase of the date compliance project.

Enterprise Inventory and Scoping. The development of a profile that describes technical environments, testing strategies, and other components involved in the conversion process.

Software and Data Assessment. The analysis phase in which automated tools are used to identify date-related issues throughout each information system.

Conversion Planning. The budgeting, team building, and identification of upgrade units or groupings of information-system components. Upgrade units are sequenced in a conversion roadmap, and data bridges are identified.

Transformation and Automated Remediation. Focuses on program renovation and unit testing. Transformation is the process of modifying non-compliant programs through file expansion or windowing. Quintic PLUS has Automated Remediation that facilitates the windowing technique using output from the assessment phase, thus reducing project length and manual effort.

Testing and Integration. Includes systems, regression and acceptance testing. Century Conversion Software, coupled with RCG IT/Quintic's Quality Assurance Methodology, ensures the delivery of validated date-compliance systems.

Migration and Production Support. The remediation of date-compliance systems into production, supported by strong change management techniques.

Broadcasters stake out turf for shortwave radio on Web

By Sharon MacIsaac

IT USED TO BE that if you wanted to listen to shortwave radio from faraway lands, you got a special receiver, put up an antenna and checked broadcast schedules to tune in.

Now, there's the World Wide Web.

The top international broadcasters, such as the BBC, Voice of America and Radio France International, are all staking out the low-cost turf of cyberspace.

"We were launched with the view the Internet was a third broadcasting medium for us" after radio and television, said Chris Nuttall, world editor for BBC News Online. British Broadcasting Corp. this year is investing 3 million pounds sterling, close to \$5 million U.S., on the 3-month-old site.

Voice of America (VOA), one of the most prolific Internet news

broadcasters, posts audio in 23 languages on its Web site. An upgrade to VOA's master control center planned for midyear should allow all 53 broadcast

languages to go up on the Web, said Richard Firestone, Web manager at the U.S. government's International Broadcast Bureau, which includes VOA.

For now, the total Web listening audience is tiny compared with the millions who tune in to shortwave, and most major broadcasters doubt that the balance will change anytime soon. At VOA, for example, there are an estimated 250,000 hits per week on the Web site vs. \$5 million weekly radio listeners.

HUGE AUDIENCE

Radio Canada International (RCI) broadcasts could reach 500 million listeners in China alone, said Bob O'Reilly, executive director at RCI. "It's going to be a long time before RealAudio can rival that," he said.

Nevertheless, broadcasters said it is important to establish a presence. "I think it's

necessary for any communications agency to be available on the Web," Firestone said. "Having that second outlet becomes another way of establishing and increasing our credibility."

And the Web is a fairly inexpensive way to seek new listeners, O'Reilly said. A shortwave transmitter could cost \$10 million.

MUSIC, TOO

Radio France International (RFI), which offers audio news-casts in five languages on the Internet, this month planned to demonstrate a Web-based "music jukebox" at the Mûdem conference in Cannes, France.

The system will let site visitors select from various French language songs and download portions to save.

The debut was delayed while copyright issues were hammered out.

Web listeners are often similar to those who would tune in to shortwave, ranging from people interested in foreign politics to those studying a new language. Immigrants, refugees and expatriates often tap in to the Web-based broadcasts to get news from home.

The RFI was first proposed by some French expatriates in the Washington area who now run the Web site from their McLean, Va., office. But it makes sense to boost the servers in the U.S., where inter-

net connections are better and less costly, said Jacques Gabeau Maréchal, president of Medianet, Inc.

People in the industry said Web-based audio has the potential to radically change the relationship a listener has with broadcasters.

"Now you're no longer depending on their schedule," said Joe Lawlor, webmaster at Canadian Broadcasting Corp. "I think an on-demand world will be the future... Forget the 500 channels. It's what I want, when I want it."

"We need to learn these digital skills, which I think will translate to digital television," said BBC Online editor Mike Smart. □

Corel faces uncertain future

Financial problems may overshadow products

By Gordon Minkling

A BRUTAL WINTER storm ravaging eastern Canada delayed the official release of Corel Corp.'s fourth-quarter results last week. But it may have been just as well.

The news coming out of Ottawa wasn't expected to get any better than the gloomy weather. The maker of WordPerfect and CorelDraw announced losses of about \$95 million on sales of \$44 million for its quarter ended Nov. 30. It was the second consecutive losing quarter for the once-stellar Corel.

"It's really a difficult situation for them right now," said Michael DeLaverge, a financial analyst at Dlouhy Investments in Montreal. "And I think it's probably going to be difficult for a while because their financial problems are overshadow-

ing their products. People may be choosing to go with the safe and stable Microsoft products."

Corel insisted it isn't in danger of going over the edge. Officials pointed to \$20 million in cash reserves and low long-term debt. The company just released an update to its popular CorelDraw program and finally expects to introduce Java products and its Video Network Computer this year.

FOCUS CHANGE

The company has been shifting its focus from retail sales to large corporate accounts. Last year, Corel petitioned a line of unsuccessful consumer products and said it would reduce retail advertising.

"I don't think they're in any immediate danger in terms of solvency. In terms of the longer-

term picture, it's very much an unknown," DeLaverge said.

But Rob Enderle, an analyst at Giga Information Group in Cambridge, Mass., predicted more dire days for Corel.

After buying the WordPerfect line from Novell, Inc. for a song in 1996, Corel set itself up to fight Microsoft Corp. in a market Microsoft pretty much owned already, Enderle said. With its forthcoming Java products, Corel will be fighting IBM and Lotus Development Corp.

"Given where they are now, they need to look for easy fights to win and stop picking fights with the big guys," Enderle said. "What I think they should do is find ways to fix things around the existing Microsoft products instead of spending a lot of money to fight them."

Corel's financial problems had some users worried but not ready to ditch Corel products.

"Anytime a company's fi-

COREL SLIDE

Corel's stock price has fallen on bad times

nances are in the dumps you wonder about their viability," said Eric Goldreich, director of information systems at law firm Sheppard, Mullin, Richter & Hampton in Los Angeles. "On the other hand, they've got a better product. It's pretty much our contention that WordPerfect is a better word processor than Microsoft Word for the legal environment."

Goldreich said the problems go back to Novell's ownership of WordPerfect, but he put some of

the blame on Corel's forays into videoconferencing and the Video Network Computer.

Greg Dines, an associate systems analyst at the Contractors State License Board in Sacramento, Calif., said his group has been happy with Corel on its 500 desktops.

"The product itself is awesome," Dines said. "We don't look at the stock market, we don't look at the rag magazines. We look at the product and the service we get." □

"Psst ... Wanna Buy Some Time?"

You Need SoftFactory/2000

There's more than one way to buy time – but you gotta know the secret. Word on the street is that SoftFactory/2000™ with SmartFind/2000™ is the only way to go if you are going to get your Y2K projects completed quickly.

The SoftFactory/2000 solution is technology-based, requiring less manpower compared to other approaches which are primarily manpower-driven supported by a little technology.

SoftFactory/2000 is so fast and so accurate, it's like buying time between now and the year 2000. That's because SoftFactory/2000 is the only Y2K solution which uses SmartFind, an intelligent problem-solving technology that filters your code to identify only true date fields and only the date occurrences that need to be fixed.

Compare that to other approaches which rely primarily on slow and expensive manpower... assuming you can find qualified people in the first place.

Time is running short, but we can get you to compliance before the year 2000. Call us at 1-800-632-6265 today.

IBM wants FAA to retire 3083s

► Pressures FAA to pull the plug on old systems

By Patrick Thibodeau

Few companies face the problem the U.S. Federal Aviation Administration now confronts: keeping 30 ancient IBM 3083 computers from suffering year 2000 failures. And if IBM has its way, the FAA won't have to deal with the problem, either.

Fewer than 100 of those old machines are still in use, according to IBM, in Armonk, N.Y. And businesses would be foolish to continue running applications — especially mission-critical ones — on them, ana-

lysts agreed.

But the FAA may be the exception. The 3083s, which were manufactured in the early 1960s, are used at a majority of the FAA's Air Route Traffic Control Centers. The 20 control centers keep track of all aircraft in U.S. airspace. The 3083s take radar information and translate it into visual display data, reporting an aircraft's location, identity, altitude, speed and destination for flight controllers.

The agency's continued use of what many observers would call obsolete machines has it at

odds with IBM. Some published reports last week claim IBM is pressuring the FAA to upgrade to newer, year 2000-compatible systems. The FAA will only say, "we have a slight disagreement about how to fix the problem."

The FAA is about a month away from completing its year 2000 assessment on the 3083s and the approximately 500,000 lines of code that run on them, said Paul Takemoto, an FAA spokesman in Washington.

"We believe we have both the tools and the people to certify [the 3083] as [year 2000] compliant," he said. Even so, the FAA may scrap the 3083s if the assessment shows they must be replaced.

The agency wants to complete repairs to the two-digit date glitch on all its computers by year's end and conduct testing through next year, Takemoto said. The 3083s, which are used in 15 of the 20 air traffic centers, were originally scheduled to be upgraded in 2003. The agency's five busiest centers — in Fort

Worth, Texas; Cleveland; Chicago; New York; and Washington — use IBM ES/3911 mainframes.

OUT WITH THE OLD But IBM isn't planning to make the 3083 year 2000-compliant. It said the machines should be replaced. "This is old equipment, and it is well past its natural life cycle," said IBM spokesman Craig Lowder. He said IBM has neither the replacement parts nor people with the skills necessary to make the repairs.

Buying the hardware for a new system wouldn't necessarily be expensive. An IBM ES/3900 workstation may have enough power to run the application. The bigger costs would be upgrading to a new operating system. Analysts estimate those costs could run anywhere from \$6 million to \$30 million for the system.

RELATIVELY EASY?

Tom Oleson, an analyst at International Data Corp. in Framingham, Mass., said the half-million lines of code that must be updated by the FAA "is a very small number that can be fixed quite rapidly given the tools that are available today." The average length of time for a company to fix date problems buried in several million or more lines of code is about two years and four months, he said.

But Oleson, who has worked with 3083s in a previous job with an insurance company, said it may be impossible to save the hardware. The 3083 processor, which has all the power of a small file server today, will not accept the date change, he said.

John Young, vice president of enterprise systems planning at The Clippinger Group, Inc., in Wellesley, Mass., was skeptical about the FAA's ability to make the machines compliant in that time frame. "Solving the problem is only the first step. The hard part is doing all of the testing to ensure that you get everything out of there — and that's a time-consuming effort." □

Super Bowl on the Web

CONTINUED FROM PAGE 1

"People want statistics. People want information," said Patrick Keane, an analyst at Jupiter Communications, Inc. in New York. "I think events in general can be very successful on the Web."

"There's an increasing trend toward events on TV using the Internet," said Jill Frankle, an analyst at International Data Corp., in New York.

PRE GAME

Before the game, fans can see live World Wide Webcasts of coach and player press conferences, chat with analysts, view animated versions of teams' favorite plays and find out more statistics than most people would ever need to know.

During the game, sites such

as Superbowl.com and ESPN SportsZone will offer complementary analysis, up-to-the-minute statistics and fan chats. For those who want a change of linguistic pace, Superbowl.com plans audio play-by-play feeds in Russian, Italian, German and Japanese.

POST GAME

After the game, CNN/SI plans to post video clips from what has become an event within an event — commercials depicting during the game.

At \$2.6 million per minute, companies tend to put a lot of effort into producing their Super Bowl spots.

The National Football League's official Super Bowl site, www.superbowl.com, this

week plans audio and video of press conferences.

And if you are itching to find out what is going on at the stadium itself, Superbowl.com expects to offer "Webcam" shots of the stadium so people can peek in and see how it is being gussied up for the Big Game.

More than 30 staffers from the site's three partners — the NFL, NBC Sports and IBM — will work on the site.

"We have a bigger production center at the game than some of the radio broadcasters do," said Ann Kirschner, vice president of NFL Interactive.

"There is a store to purchase official Super Bowl merchandise, of course, as well as game analysis and some comedy programming from Jay Leno.

COMPLEMENTARY

Superbowl.com doesn't plan to compete with the televised Super Bowl, which garners millions of dollars in broadcasting fees. Instead, Kirschner sees the site as complementary, offering a deeper level of information and analysis for a "two-screen" Super Bowl.

And although the Internet can't rival the millions of viewers expected on NBC, Kirschner said the Web is a profit center for the NFL, thanks in part to revenue (amount undisclosed) from IBM as the site's exclusive partner.

The league's regular site at www.nfl.com also plans extended Super Bowl coverage.

ESPN (<http://espn.sportszone.com>) will feature an array of statistics, scouting reports and his-

tory, along with analysis from former quarterbacks Joe Theismann and Ron Jaworski, trivia tests and online chats.

On game day there will be a mix of play-by-play and constantly updated graphics and statistics. Post game highlights will feature user polls on best and worst game commercials, among other questions.

VIDEO, ANIMATION

CNN/SI, a joint venture of Cable News Network and Sports Illustrated (www.cnn.com) is posting Shockwave animated plays for both teams, streaming video of game-week press conferences and, of course, the ubiquitous Super Bowl merchandise store.

Nobody seems willing to predict how much traffic they will handle on Super Bowl weekend, although IBM has planned for up to 40 million hits per day at Superbowl.com. Kirschner said, "I would no more hazard a guess on that than who's going to win the Super Bowl." □

Web Meltdown Insurance from Forté

You know it's coming: server meltdown. That's both the good news and the bad news. Good news, because you *want* the Web hits. Bad news, because even if you have the biggest server

in the world, it won't be big enough. Unless you have **Forté WebEnterprise™** meltdown insurance. Well worth it, since application downtime means lost business.

With Forté, applications transparently fail over and automatically load balance across servers. With access from HTML, Java applets or JavaBeans. So, what're you waiting for — a customer-demand

meltdown to destroy your Web site?

Call 800-622-5076. Or [click here](#) to demand your ticket to the next Forté seminar in your area.

Labor confab issues call for training to combat shortages

CONTINUED FROM PAGE 1

company in Buffalo, N.Y.

"This is all about competitiveness," Fitzgerald said. "We're not sitting in this game. We're late to the party."

Fitzgerald spoke at last week's National Information Technology Workforce Convention here. The conference, which was attended by about 300 people from industry, government and academia, focused on raising awareness of the labor situation and developing ways to address the issue.

SCARY FIGURES

More than 146,000 IT jobs remain unfilled because of a lack of skilled workers, according to a 1998 study by the Information Technology Association of America (ITAA) [CW, Jan. 12]. The ITAA study (www.itaa.org) also revealed that 88% of 512 companies surveyed retain existing staff, 40% hire immigrants to the U.S. and 16% outsource to non-U.S. contractors.

In the next decade, the U.S. Labor Department estimates that another 1.3 million workers will be needed to fill new high-tech jobs. Perhaps with that in

mind, government and industry last week waved dollars to back their all-out training push.

The Labor Department said it will distribute \$3 million in grants to retrain laid-off workers as programmers and another \$8 million to build an online recruiting site where employers and candidates can post job openings and resumes.

With gross revenue of \$866 billion annually, IT is the largest U.S. industry. Government figures show that the software industry in particular is growing at twice the rate of the overall economy.

The Commerce Department will tack in another \$7 million to bring technology and training to the poor.

Another \$6 million in grants will go to industry groups that foster internship programs and vocational training at companies for young people.

Companies, meanwhile, are boosting in-house programs to continually retrain IT workers already on board, as well as newly hired college graduates with music, history and other non-IT degrees.

For example, in an unusual move, CTG, which spends 2% of its annual revenue on IT skills training, has hired a group of dedicated career development managers.

Their sole job is to track and manage the skills portfolios and career plans of IT workers. Each manager tracks seven to 20 workers. Managers' compensation is based on how well they retain IT staffers.

Beaverton, Ore.-based Claremont Technology Group, Inc., a \$50 million systems integration company, recently doubled its IT training budget from 2.5% to 5% of revenue, or about \$4.5 million annually.

FILLING THE GAP

A sampling of programs aimed at filling the IT skills gap:

Detroit School of Industrial Arts

Contact: Carl Luty, Corporate Business Solutions, Inc., at gluty@csbcs.com

Offers technology training to high school students enrolled in charter schools

"But the issue for us is not the dollars. It's the time to do the training," CEO Paul Cosgrove said. "If people really want to stay current, they may have to do these training courses on their own time."

Underscoring the big emphasis on training were briefings from organizers of several successful IT training efforts already under way, including the Massachusetts Software Council's 5-year-old Fellowship Program. So far, more than 300 professionals displaced from the defense, aerospace and other industries have been graduating from the 5½-month program, which concentrates on the behavioral and cultural changes

workers must make to fit into the software industry.

"Most of the fellows come from very large companies and are used to working in very hierarchical structures and taking orders," said Council President Joyce Florin. "We refocus them to be much more hands-on. They learn to take risks and to learn by doing. They learn that you make mistakes, but also how to recover from them quickly."

Almost 90% of the program's graduates now work in the software industry, starting at an average salary of \$50,000, she said.

Special: office location to lure IT talent. Page 41

Are hiring managers just being too picky?

WHAT IT labor shortage?

There really is none, according to Norman Matloff, a professor of computer science at the University of California at Davis.

Instead, it is all a myth being perpetuated by supersucky employers who refuse to hire the vast number of workers with experience in older technologies.

"Employers are shooting themselves in the foot because they're only willing to hire certain groups of people," Matloff told a stunned audience at last week's National Information Technology Workforce Convention in Berkeley, Calif.

"Employers are obsessed with hot skills," Matloff said. Meanwhile, plenty of other talented programmers who could easily learn new skills remain unemployed.

Matloff's research (<http://hacker.ics.ucdavis.edu/~norman/papers/hw.html>) indicates that high-tech jobs, including Microsoft Corp., hire only between 2% and 5% of candidates who apply for IT jobs.

OLDER WORKERS

Additionally, age discrimination against midcareer programmers over 35 is rampant, Matloff charged.

Companies want recent college graduates and foreign nationals because they can pay them less, he said.

Not at Electronic Data Systems Corp. in Plano, Texas.

Following Matloff's presentation, Marsha Clark, an employee development executive at EDS, told him: "I'd like to come live in your world where you think there's no shortage."

"On any given day, we have

between 5,000 and 10,000 vacancies. We're hiring more of every kind of people we can," Clark said.

Overall, Matloff's assertions stood in stark contrast to the Information Technology Association of America's findings, the Labor Department's projections and the experiences of many attendees from the industry.

"I've never seen a period of time like this," said Bob Fortman, an executive at IMI Systems, Inc. and 20-plus year veteran of the IT industry. "Midcareer people are extremely valuable. People with CICS, Cobol and DBs are very valuable with the year 2000 problem."

The bottom line, he said, is that "anybody today that can program and communicate is going to have a job."

—Julia King

Venerable IS journal shuts down

By Sharon Machlis

DATAUMATION MAGAZINE is shutting down after 40 years of publication, a victim of red ink and stiff competition. Cahners Publishing Co. spokesman Margaret Partridge confirmed last week.

The February issue will be the last, but the Plug-In Datamation World Wide Web site will continue, with some of the magazine's approximately 50 employees possibly landing jobs on the Internet version.

Datamation, the first computer industry trade publication, was launched by Technical Publishing in New York and sold to Cahners in 1986 when the Newton, Mass.-based firm acquired Technical from Dun & Bradstreet Corp.

The magazine targeted information systems professionals

and claimed a circulation of 199,000.

As losses mounted, the magazine went from a twice-monthly to a monthly publication in 1996.

The Datamation shutdown is part of a decision by Cahners to pull out of the computer publishing business and concentrate on its other markets, such as manufacturing and entertainment.

Late last year, Cahners sold several other computer publications, including Government Computer News, to The Washington Post Co. □

Microsoft's Office 98 Mac gets mixed reviews

► Critics call it bloated, optimists praise the possibilities

By Gordon Mak Ung
San Francisco

DIE-HARD MACINTOSH loyalists remained skeptical, but many Macintosh users saw Microsoft Corp.'s first Macintosh product launch since its investment in Apple Computer, Inc. as much needed good news.

Microsoft threw a coming-out party for the Office 98 Macintosh Edition software suite at the recent Macworld Expo here. Critics called the product bloated, but optimists considered it proof of Microsoft's commitment to Apple after its \$150 million investment in August.

Redmond, Wash.-based Microsoft, long viewed as the foil for all things Macintosh, plans to have the suite on store shelves by March and has begun pre-bookings sales through its World Wide Web site (www.microsoft.com).

For some, old habits die hard. "It's still not that great," said an underwhelmed Irwin Yamasaki after watching a demonstration of the business productivity suite. "I'd rather have a speedier product that's not bloated."

Yamasaki said the minimum memory requirements to run just one Office application — 16-M bytes, according to Microsoft — are too much for the machines in his office at the University of California in San Francisco.

Office 98's compatibility features have great potential — once people get used to the idea.

— Gene Stull

Lockheed Martin

Others were guardedly optimistic. Alan Schaeffert, a network consultant at AYS Associates, in San Francisco, said if Office 98 lives up to its demonstration, he will be able to complete his work without a Windows PC. "Right now, I find myself doing some [of my work] on the Mac and then going to Kinko's to do the rest [on Windows machines]."

Office 98 includes new versions of Word, Excel and PowerPoint and the new Internet Explorer 4.0. It also has Outlook Express, an Internet mail client, personal information manager and news reader.

Microsoft officials said Office 98 will run on any PowerPC Macintosh with System 7.5 and up, but they recommended at least a 120-MHz processor and 32-M bytes of RAM. The average footprint on the hard disk is about 90-M bytes.

Microsoft officials said their research indicates that the average Macintosh is in better shape to run the suite than Windows 95 machines were when Office 97 was issued a year ago.

Gene Stull, an engineering manager at

Lockheed Martin Corp., in Greenbelt, Md., agreed. He said most of the defense contractor's Macintoshes should be able to run the suite right out of the box.

Stull said Office 98 has great potential

once people get used to the idea. A Macintosh Excel spreadsheet user's ability to edit a document concurrently with other users, including Windows machines, is a key feature, he said.

But he added that even with all the new features in Office 98, such as customized

network installations and self-repairing applications, Lockheed Martin is "interested, but not excited."

Stull said the number of Macintosh desktops at the company has dwindled to about 25% of the end-user population, with the rest using Windows-based machines.

The regular price of Office 98 is \$499; the cost to upgrade from a previous version is \$299. □

y Application, Unicenter.

These days, managing applications is harder than ever.

From change management and deployment to performance monitoring and event management, today's applications come with all kinds of requirements. And each one has a direct impact on reliability, availability, high performance, and serviceability.

That's why any application is really only as good as the management software that's behind it.

And why 95% of the Fortune 500 chose Unicenter® TNG™ to manage their applications.

Unicenter TNG Is A Single, Complete, Integrated Solution For Enhanced Management And Control Of All Your Applications.

Whether it's for an off-the-shelf software package or your own home-grown applications, Unicenter® really does it all. It offers everything you need, including change and configuration management, software distribution, security, backup/recovery, event monitoring and management, performance management, scheduling, and help desk.

You can instrument your applications without having to modify them. And by managing both the applications as well as the computing infrastructure in which these applications run—Unicenter TNG ensures optimal availability, scalability, and manageability of your business-critical applications.

In short, you can expect some amazing results!

Users applaud Bell ruling but don't expect immediate benefits

By Matt Hamilton

NETWORK MANAGERS are praising a federal judge's recent decision that lets the Baby Bells compete for long-distance voice and data services. But many are skeptical that the anticipated low prices

and new benefits will hit any time soon. "Whenever there's more competition, the end customer gets better deals," said Gailor Best, a network engineer at Travelers Property Casualty in Hartford, Conn.

But users also wondered when the im-

pact of the ruling will be felt because of lengthy appeals expected from the Federal Communications Commission and long-distance companies.

Also, several managers questioned whether the Bell companies will have the expertise to provide the highly rel-

able long-distance service businesses demand.

"I have absolutely no faith that local carriers can provide good long-distance service based on my experience with local carriers," Best said.

U.S. District Court Judge Joe Kendall ruled Dec. 31 that portions of the Telecommunications Act of 1996 are unconstitutional. Those portions include restricting the Bell companies from entering the \$300 billion annual long-distance market.

TIME WILL TELL

"The ruling sounds good for competition, but it's too soon to figure out if it's a benefit to corporations," said Joe Gallo, vice president of corporate telecommunications at Automatic Data Processing, Inc., in Roseland, N.J.

Gallo's company spends millions of dollars each month on voice and data carriers and can leverage attractive long-distance rates. Analysts said large users can negotiate rates to about 5 cents per minute.

"The ruling sounds good for competition, but it's too soon to figure out if it's a benefit to corporations."

**- Joe Gallo
Automatic Data Processing**

"Our hope would be that rates would get down to 5 cents a minute" with more competition, Gallo said.

But some analysts worried that the ruling would embolden Bell companies to delay long-distance companies from entering their local markets as required in the 1996 law. "We don't have significant local competition, and customers want that," said Rob Rich, an analyst at The Yankee Group, in Boston.

HEAD START

If the Bells enter the long-distance market without opening their local markets first, they will have an unfair advantage that could lead to dominance in long-distance service and eventually higher rates, according to Richard M. Hesley, a director of the Communications Managers Association (CMA) and president of Rockefeller Group Telecommunications Services, Inc., in New York.

Aside from lower prices, Gallo and other managers said they want the ease of integrated billing.

But integrated billing is a double-edged sword, analysts warned. Users should still plan to hire more than one carrier to prevent disasters from cable cuts, said Ellen Van Cleave, a director of the CMA, in Morristown, N.J. □

From Desktop to Enterprise

Leaders in I/O Technology

The demand for device driver portability between operating systems and host platforms, combined with increasing requirements for intelligent, distributed I/O processing has led to the development of the Intelligent Input/Output, or I/O specification. BMC Software and Intel Corp. are working closely with the I/O Special Interest Group (SIG) to bring I/O-compliant technologies to market, including integrating PATROL Management solutions with the Intel i960RP I/O processor.

"The importance that the Intel/BMC relationship brings to the market is that BMC's innovation in I/O technology naturally makes them a leader in this collective new I/O-centric industry," states Alan Steinberg, Director of New Business Development, Connected P.C. Division at Intel. "Currently we have companies coming in from the desktop and from other areas of the industry that don't necessarily have the Enterprise experience BMC Software has to deal with the type of I/O that is needed in what could be called the new 'open mainframe' world."

Steinberg envisions a world where Microsoft will provide the main operating system, Intel will provide the hardware architecture and BMC Software will contribute the key I/O-compliant management technology. BMC Software's role will be to help architect what Steinberg calls the "highly available, highly manageable open system mainframe" on the I/O space.

Bob Beauchamp, Vice President of Strategic Marketing and Corporate Development for BMC Software, agrees. "The pervasiveness of the i960 chip in the Windows NT and NetWare environments, combined with BMC Software's PATROL technology, will empower

customers with unprecedented management and monitoring capabilities from the application to the motherboard."

Clearly, the ability to gather statistics regarding I/O is a great step forward. The PATROL Application Management Suite completes the picture by correlating I/O statistics with the applications that are utilizing the I/O components or sub-system. This allows unprecedented optimization capabilities, such as automated load balancing, cache reallocation, and the rerouting of network traffic. All of these capabilities can be performed on demand and are based on the performance requirements of the applications.

Currently, no two vendors come as close as Intel and BMC Software in providing this comprehensive approach to I/O processing and manageability.

"We've moved into a new paradigm where I/O is as important as the central CPU technology," states Steinberg. "This shift will allow BMC to proliferate its management product line in the open systems environment. Pairing Intel I/O technology with PATROL is just the very beginning. It's the first product of many, as this new I/O-centered technology emerges into the marketplace, and we think it's going to be an exciting ride."

Intel
Corp. is integrating
PATROL®
management
technology into the i960RP®
PATROL I/O processor in order to
provide the direct management
capabilities for I/O subsystems
customers are asking for.

Top industry leaders are relying on PATROL, for a reason. To find out why visit us on the Web at www.bmc.com/patrol Or call today: 800 811-6766

Outsourcing, with safeguards, can solve client/server problems

► IS struggles to manage complex networks

By Patrick Dryden

IS MANAGERS ARE having trouble managing complex client/server networks because expertise is scarce and central management processes are still evolving.

Although many information systems groups loathe the idea of surrendering control, they can get help by selectively outsourcing some chores, analysts say.

Survey data from integrator International Network Services, Inc., in Sunnyvale, Calif., describes the dilemma. More than 100 respondents cited difficulty in fielding experienced staff

to handle the complexity and breadth of services in their network operation centers, including:

Some companies are out-tasking: maintaining control over vital network resources while turning over specific functions to third parties.

ing the integration of network and systems management. However, the respondents

also said they are hesitant to look elsewhere for help.

"We have to maintain control ourselves," said Robin Farasat, network services manager at the research and development division of Roche Bioscience, in Palo Alto, Calif.

External service providers can't keep the growing network up to date and flowing smoothly as client/server applications gobble bandwidth and demand quick response, according to Farasat.

Yet keeping up internally is a constant struggle, he acknowledged.

For example, major internet-working vendors that are based nearby drain available talent. "We really have trouble finding

HITTING THE WALL	
Quoted barriers to extending network capabilities	
Network operations too critical to outsource	60%
Service too expensive	30%
Lack of service provider capabilities	30%
Justifying cost/benefit to upper management	20%
Insufficient service-level commitments	20%
Lack of global operational coverage	10%
Basic 24x7 IS emergency on-call response almost universal	

Source: International Network Services, Inc., Sunnyvale, Calif.

and keeping network experts on staff," Farasat said.

The state of Michigan can't match salaries offered in the private sector, said Bryan Ryhal, manager of the state's consolidated network operation center, in Lansing. To cope with turnover, he tries to retain staff expertise in expert system software to ensure smooth operations while newcomers come up to speed.

IS groups often lack the time

or the ability to apply available management tools and to interpret the statistics they reveal, according to Ellen Carney, an analyst at Dataquest, in San Jose, Calif.

Implementing management tools is like buying a bathing suit in February to wear in June, Carney said. He added, "They think they can handle the situation in-house, but a lot must fall into place before they get any benefit."

Few IS groups will risk rendering "the family jewels" entirely to outside service providers, Carney said.

But it is possible, given adequate safeguards.

For example, American Airlines doesn't worry that its IS arm, Sabre Computer Services, turned over global network management to Paris-based SITA Group, said Scott Nason, chief information officer at American Airlines, in Fort Worth, Texas.

"It's not a situation where the vendor's only reason to do a good job is to keep us happy. Sabre also depends on 100% reliability from the same network, so we're comfortable with outsourcing," Nason said.

OUT-TASKING

Because control over vital network resources is paramount, the trend is toward turning over specific functions, often called out-tasking.

"Sophisticated organizations seek help from strategic partners in a few areas yet retain central control for accountability," said Kitty Weldon, an outsourcing analyst at The Yankee Group, in Boston.

Selective outsourcing overcomes the threat of staff replacement while securing scarce expertise, said Ray Paquet, a management analyst at Garner Group, Inc., in Stamford, Conn.

"IS managers must recognize there's no loyalty anymore. These experts are all free agents, hired guns available to the highest bidder," Paquet said. □

► Buyers must factor in compatibility

ERP systems cast shadow across business units

By Randy Weston

WHEN MONSANTO CORP. decided to implement a bar-code system, it chose a more user-friendly product over one that integrated well with its SAP AG R/3 software.

It was a decision that project leaders are now trying to take back.

"We berated and hawed and decided to let users have their way," said Gary Banks, SAP project leader at the St. Louis-based chemical manufacturer. "We regret it. The technical interface has been too much. We will probably be walking away from the more user friendly product."

The hard decision that Monsanto faced is being played out in information technology departments everywhere. Users who make enterprise resource planning (ERP) systems the backbone of their corporate computing environments are finding that it affects all other technical decisions.

"You pick an application package and with it comes an infrastructure that largely becomes your infrastructure," said Joshua Greenbaum, an analyst at Hurwitz Group, Inc. in Framingham, Mass.

Often, as in Monsanto's case,

it may mean going with third-party software because it is more compatible with a chosen ERP system rather than a more functionally rich first choice.

But users at security equipment maker Sensormatic Electronic Corp. like the idea of standardization.

"Any software packages we pick must integrate with Baan, pure and simple," said Dennis Torrelli, vice president of information systems at the Boca Raton, Fla. company. "In picking third-party packages, it's like wanting vanilla, chocolate or strawberry. They are all basically the same. This makes life more simple because now we say if it integrates with Baan, then part of our job is done."

"Our use of R/3 is becoming a major consideration whenever we evaluate new hardware and software," said Diane Schwarz, manager of information strategy and tactics at Steelcase, Inc. in Grand Rapids, Mich. "One of the first questions we ask vendors is 'What is your relationship with SAP?'"

FALLOUT

Steelcase, an office furniture manufacturer, is feeding the ripple effect of its a-year-old SAP project in areas untouched by R/3.

"I now support sales and marketing information systems" that aren't part of the R/3 package, Schwarz said.

"When we start thinking of putting in new data warehouses or data marts, we now have to care that we have SAP under our roof. We can't go out independently and buy [data mart] tools, even though we don't own SAP in this department."

That's because data that flows throughout the company moves from the ERP transaction software. So any attached software must be able to read that

data and feed accurate data back into it.

Harry Teo, an analyst at The Yankee Group, in Boston, said users are getting a variety of choices to tackle the problem as niche vendors jump on the ERP bandwagon. But that doesn't mean wrong choices can't be made.

Sometimes, the vendor underestimates the complexity of R/3. Other times, SAP itself hadn't built a good enough application programming interface.

Banks emphasized, however, that SAP is a far better system than the legacy mainframe and that the benefits of centralized transaction processing are worth the potential hassle.

Corning, Inc., a

\$4 billion glass and ceramics manufacturer, hopes to head off compatibility problems by using a centralized architecture committee that will review all projects worldwide. The manufacturer is standardizing on PeopleSoft, Inc.'s software, said Steve Cooper, director of strategic information systems at the Corning, N.Y. company. □

With PeopleSoft in place, a centralized architecture committee will review all projects worldwide.

Computer Industry

Briefs

Intel revenue hits \$2.5B

Intel Corp., based in Santa Clara, Calif., last week sold the revenue for 1997 was up 26% from the previous year, to \$2.5 billion. Intel also sold the Pentium II and MMX graphics technology sales for its second. Fourth-quarter revenue was \$645 million, up from \$643 million in the same quarter in 1996. Net income for 1997 was \$645 million, up from \$545 million the previous year.

Netpage to lay off 400

Netpage Communications Corp. announced it will lay off 400 full-time employees and contract workers as part of its restructuring efforts, a spokesman confirmed last week. The company employs about 1,000 full-time staff and 500 contract workers.

ABB cuts its losses

Advanced Business Systems, Inc. reported a \$6.5 million fourth-quarter loss on sales of \$11.5 million — an improvement over a loss of \$10.5 million on sales of \$10.5 million a year earlier.

NET about conditions

Digital Equipment Corp. has implemented a new policy of "no conditions" to its customers. The company is now reporting a loss of \$1.5 million on sales of \$1.5 million for the second quarter ended Oct. 31. That compares with a profit of \$1.5 million on sales of \$1.5 million in the same quarter a year earlier. Digital reported a loss of \$1.5 million on sales of \$1.5 million in the same quarter a year earlier.

Apple posts profits

Apple Computer, Inc. reported a profit of \$1.5 million for the quarter ended Oct. 31, compared with a loss of \$1.5 million in the same quarter the previous year. That sales fell 10% from \$1.5 million to \$1.4 million. The company's fourth-quarter profit was \$1.5 million.

Prepaid licenses hurt database sales

By Craig Steadman

THE PRACTICE of advancing large blocks of database licenses to users who activate them over time is biting back at vendors as the market matures and growth rates level off.

So-called "prepays" are contributing to the revenue shortfalls that companies such as Oracle Corp. and Sybase, Inc. are encountering, analysts

said. As selling prices fall because of the growth of packaged appliances and cut-rate Windows NT databases, vendors are finding that they can't always depend on the installed base for more sales, the analysts said.

Take Dunlop Tire Co., for example. The Amherst, N.Y., tire maker purchased a big batch of Oracle user licenses in 1995 to take advantage of discount offers, and it still hasn't deployed all of them.

"We really haven't spent money on databases in a while since

we bought a lot more [licenses] than we needed up front," said Hugh Allan, manager of information technology at Dunlop. The 1993 purchase also covered related products such as Oracle's applications and development tools, he said.

The allure of prepayments for users is that vendors will discount prices up to 40% or more

SOFTWARE LICENSING

on such bulk purchases, said Richard Finkelstein, president of Performance Consulting, Inc. in Chicago.

That kind of savings is hard to pass up if budgets have room for software that isn't always right away, Finkelstein said. Stashes of unused database licenses are "extremely prevalent," he said. "It's common for me to walk into a client site and find licenses that are inventory and looking for a use."

When companies were more flush, vendors could usually keep revenues marching upward just by finding new buy-

Factors that help hold down database sales:

- Canceled client/server projects that leave database licenses unused
- Prepayment for excess licenses that users bank for later deployment
- Intranet applications that reduce the need for distributed databases

Source: Performance Consulting, Inc., Chicago

ers. But growth is harder to come by now that databases are becoming more commodity-like.

Oracle in Redwood Shores, Calif., managed only single-digit database growth in the past two quarters. Meanwhile, Emeryville, Calif.-based Sybase this month said fourth-quarter 1997 sales and earnings will be lower than expected (CW Jan. 12).

Vendors aren't taking the situation lightly. Sybase is accelerating a sales force restructuring, and Oracle said CEO Larry Ellison plans to tone down his network computer evangelizing and get more involved in the company's database business again.

The past two quarters were "kind of like a wake-up call," a

spokesman said.

Prepaying isn't the only factor. "But the danger is that vendors can use it to make their numbers if they're short at the end of a quarter," said Merv Adrian, an analyst at Giga Information Group in Cambridge, Mass. Doing that over and over isn't easy, he said. Some vendors that have been stung by prepays have tried to move away from them in recent years, most notably Sybase, Adrian said.

But Private Healthcare Systems, Inc. bought about 300 Sybase user licenses last spring, even though it won't deploy them all until mid-1999, said Lisa Thompson, vice president of business systems at the Wal-tham, Mass., managed care services firm. □

Where Microsoft leaves off, tiny O'Reilly steps in

By Carol Slawe

O'REILLY & Associates, Inc. makes World Wide Web server software that runs on Windows NT. That means its chief competitor is Microsoft Corp., which bundles its Web server with the operating system.

Yet somehow O'Reilly survives.

The privately held company in Sebastopol, Calif., ranked fifth in market share in a January poll of 1.8 million Internet-accessible Web servers. The poll was conducted by Netcraft Ltd., a U.K.-based consultancy. According to the survey, O'Reilly has 5% of the market, compared with Microsoft's share of 22% and Netscape Communications Corp.'s share of 10.5%.

"There's a very nice business in the cracks between what Microsoft and Netscape leave on the table," said Tim O'Reilly, president, founder and owner of

"We're not trying to compete with Microsoft and Netscape in the Fortune 500 deals because they're going to say, 'Hey, who are you guys?'" O'Reilly said.

Not surprisingly, given its book publishing experience, O'Reilly tries to distinguish itself with extensive documentation about its products. The WebSite Professional server

a variety of programming languages, tools and development environments, including Java, Perl, Python and Visual Basic.

"They have a large and loyal following amongst developers through their Nutshell series of books," said Michael Gouldie, an analyst at Boston-based Patricia Seybold Group. And that, in turn, helped spur the company's following in the Web server market.

O'Reilly also branched out into other niche markets by selling chat software, a Web authoring tool for forms, and a Perl resource kit.

O'Reilly said last year's revenue was \$55 million.

"If they were to be solely a Web server company, long term that could be a problem," said Heather Ashton, a research analyst at Hurwitz Group, Inc., a consultancy in Framingham, Mass. "They have other forms of business." □

We're not trying to compete with Microsoft and Netscape.

Tim O'Reilly
O'Reilly & Associates, Inc.

the nearly 30-year-old company, which specializes in publishing non-merchandise computer manuals.

The company targets people at independent Internet service providers, software consultants and other smaller companies who run a Web site and also make purchasing decisions.

ships with two volumes that contain more than 900 pages that promise to educate and inform Web server administrators.

Another key distinction is that the O'Reilly servers support

Objects @ Work.

Objects @ Work. It's objects.

Example: is the future of objects.

It's the first complete and pure object solution.

It's not a hybrid. It's not hype.

Jasmine is real. A proven, complete object-oriented database and development environment. So now, you can build the next generation of multimedia business applications and run them everywhere: client/server, Internet, intranet, and extranet.

Introducing The Industry's First Multimedia, Internet-Enabled Object Database.

With built-in multimedia and Internet support, Jasmine has it all. A pure object-oriented database. Drag-and-drop development environment. Distributed object delivery. Efficient database multimedia storage and manipulation, and efficient delivery through streaming and caching. The industry's easiest development environment lets you use all your "favorite" tools: built-in VB integration, native Java support, and C++ support.

Unlike hybrid or partial object solutions, Jasmine actually works.

So you can shorten your time to market and gain a distinct competitive advantage.

If that sounds good to you, call today. One right now. Because it's not.

Call today.

Java holds its own, starts to make inroads

By Sharon Gaudin

NOW THAT JAVA has a couple of years under its belt and users have a few scrapes on their knees, mainstream corporate developers are hoping it is finally time to take off the training wheels.

Java—the language, the development environment and the platform—has gone through one hell of a test drive. It has fended off direct attacks from Microsoft Corp. struggled with its ambitious claim to fame of platform independence and grown into more than an amateur display of spinning coffee cups and barking dogs.

But throughout the turmoil and spit fights, Java has quickly become the Holy Grail for originator and main proponent Sun Microsystems, Inc. It garnered a cultish following of 750,000 developers; and

worked its way into major corporate houses—all in just two years.

Not bad, considering that it took development language powerhouse C++ the same amount of time just to get its sea legs. In that time, Java has thrown the industry into a technical frenzy and spawned hundreds of Java-focused start-ups.

CROSS-PLATFORM KEY

And Java has made those inroads mainly because it is a cross-platform development language.

Corporate developers are turning to Java because they can create a Java-based application that will run on their Windows NT machines, Unix boxes and any Macintosh desktops. For instance, without having to rewrite it for each platform. That saves them time and frees developers to build new applications and spend

less time reworking old ones.

Developers also like the fact that Java is a powerful language, much like object-oriented cousin C++. But it is easier to use than C++. Developers are made to jump through fewer hoops and are given fewer ways to make mistakes.

Developers haven't liked Java's speed, however. Compared with C++, it has been downright draggy. But that problem seems to be on the mend with new just-in-time compilers that will add some pace. And in June, Sun is expected to release its highly anticipated HotSpot Virtual Machine, which promises to match Java's speed with C++.

But with all the advances Java is making, developers still worry about how

Sun's gunfight with Microsoft will play out. Microsoft wants to derail Sun's fun because platform independence means users could look outside Windows.

Should developers invest in technology that is so heavily and frequently lambasted by Microsoft with all its industry clout and financial support? It is a question many are chewing on before jumping into the arena.

And Sun this past fall turned the spotlight full force on itself by becoming the official submitter of the Java standards effort to the International Standards Organization.

Sun, which has always called Java an open technology, now is the only company holding the open ❶

FAQs: Dissecting the language

Q: What are Java's good points?

- It offers platform independence, so users aren't locked into one platform or one vendor
- It is a powerful language that is easier to use than C++
- Sandbox security model keeps applets away from critical systems functions
- Lightweight code moves quickly across the Internet

Q: What are Java's bad points?

- Achieving platform independence still depends on correcting variations in the way applications and Web pages appear on some platforms
- Developers often consider sandbox security too restrictive
- Its speed lags behind powerhouse rival C++
- It is a technology caught in the cross fire between Sun and Microsoft. Users are left waiting for the smoke to clear before they choose a camp in which to pitch their tents.

Q: What's up with Java Development Kit 1.2?

- A: Sun is promising users the magic mix of speed, security and seamless platform independence, all wrapped up in the latest version of its Java Development Kit (JDK). JDK 1.2, which went into beta last month and is slated to ship in June, is expected to add the following:
- Permission management for security
 - Java Foundation Classes, which will give the development environment capabilities such as drag-and-drop and two-dimensional imaging
 - The highly anticipated HotSpot Virtual Machine, which is expected to greatly increase Java's speed

Q: What's happening with standardization?

- A: Only a few months after members of the International Standards Organization approved Sun to be Java's official submitter, the specifications for the language, the virtual machine and the application programming interfaces are being cleaned up and prepped for official submission, said Jim Mitchell, vice president of technology and architecture at JavaSoft. It will be six to eight months before the specs are submitted for review, he said. Sun needs a two-thirds vote for acceptance, but expects to spend seven to 11 months negotiating and answering technical and political questions before getting a go-ahead. Making Java a standard means users will be able to depend more readily on a common look and feel when using the language and the platform.

TALLY SYSTEMS

Users praise business benefits of Java

► Language eases creation of Internet, network computer apps

By Sharon Gaudin

WHO'S USING JAVA — and what are those companies using it for?

Two years after Java's official delivery by Sun Microsystems, Inc., the language is a long way from replacing any mainframes or sending Windows packing.

Still, Java is well past the toy-technology stage. At some large companies, it is making inroads as a solid tool for important applications.

And as some information systems shops, Java has already proved its worth on major projects.

The early candidates have an Internet-centric flavor, such as stitching together legacy systems to display them on the World Wide Web or building programs for network computers.

But users also are discovering Java's pleasant little secrets. Development time can be slashed with Java compared with languages such as C++, and Java offers far greater flexibility than Web-based languages such as Hypertext Markup Language.

The Home Depot, Inc. is doing some building of its own and developers there

hope Java will ease some of the growing pains.

The Atlanta-based chain of home improvement superstores is looking to change the PCs and registers in its 626 stores to network computers, and it plans to use Java to build applications for the new system.

"I want [network computers] so I don't have to have a hand-drive to deal with every time I turn around," said Curtis Chambers, architect of distributed applications at The Home Depot.

"That way I can keep my cost per unit

Service Merchandise's Dan Muehrshus says Java is helping him build up his networked system because it is lightweight and runs well over the Internet

down, because I don't have so much invested in hardware. I can centralize my applications and distribute them where I want. Java will build me those applications," Chambers said.

Michael Anderson, director of IS at The Home Depot, said Java is an easier language with which to build, and that speeds up development time.

"Based on the way Java is architected, some of the heartbeat we've had with

our PC applications has been eliminated. We'll cut our support by 75%," he said.

Service Merchandise Co. is using Java to redefine how it sells to customers.

The Brentwood, Tenn.-based retailer is moving its inventory, shipping and gift registry applications onto the Internet to increase employee and customer access. And it is using Java to connect those disparate processes and make them look like one application.

"We put these processes onto the Internet to be all our stores together," said Dan Muehrshus, director of new technology at Service Merchandise. He said Java is helping him build up this networked system because it is lightweight and runs well over the Internet.

And because Java is a cross-platform language, Java-based applications can be into Unix or Windows NT boxes, so Muehrshus said he doesn't have to worry about costly hardware changeovers in various store and warehouse locations.

Money magazine built its Web site using Java so it could offer its readers customized pages of investment advice. Dan Woods, director of editorial tech-

nology at Time, Inc. New Media in New York, said he created nearly the entire www.money.com site using Java and Sun's Java Web Server. That shored the length of the project by two-thirds and enabled the site to handle a million page views per week. When you navigate through the site, nine out of 10 Web pages coming at you come through the Java Web Server, Woods said. "Java is a cleaner language

Dan Woods at Time, Inc. New Media says Java's dynamic page-creation capabilities have enabled him to build a site to which he can sell custom subscriptions

so it speeded up the whole development process. There's a whole class of bugs in, say C++, that we don't even have to worry about with Java."

Woods said Java's dynamic page-creation capabilities have enabled him to build a site to which he can sell custom subscriptions.

"Our site is about investment advice, and we can sell access to other companies — like investment houses — that want to give something away to their customers for signing up," he said. "With the Java Web Server, we can recognize each user coming to the site and create a dynamic page just for them with their company's logo on it. That's making us some money." □

Fred Hays, Computerworld's West Coast bureau chief, contributed to this report.

UNSCRAMBLING THE JAVA JUMBLE

	Sun	Microsoft	Netscape
In a nutshell	Java is Scott McNeely's road into the spotlight — good for the client, the server, the Internet and the kitchen sink.	Java is a nice enough language, but all you need is Windows.	Java is another weapon to fight off Microsoft's intrusion in the browser market.
Position on Java	The platform-independent development environment for PCs, NCs, smart phones, smart cards, toasters, air conditioners, etc.	Java is a good language but a useless platform in the Windows world.	Pure Java is crucial for cross-platform business applications on intranets, extranets and the Internet.
Product support	Sun and its products support the full Java Development Kit (JDK) 1.1. That's not surprising since the company developed it.	Microsoft has a hot-selling virtual machine, Visual J++ development tool and application foundation classes. Sun is suing Microsoft over its Java Implementation in its Internet Explorer 4.0.	Netscape Navigator 4.04 supports most of JDK 1.1, but not the security model. The company expects full JDK support by mid-1998.
Industry support	Sun has put together a high-tech brain pack that includes IBM, Oracle, Netscape and Novell.	Who needs support, they're Microsoft! When asked who their supporters are, the company said, "Everyone else."	Netscape has partnered with Sun and third-party developers.
What's coming	Expected in June: HotSpot Java Virtual Machine, Java Foundation Classes, Java Blend development tool and JDK 1.2.	A new version of Visual J++ is due later this year.	The next major version of Navigator in mid-1998 will have full JDK support. Support for JDK 1.2 is planned for the same quarter. Sun releases R (expected Q3), and Netscape is working on all-Java version of Navigator, dubbed "Javagator."

OPINION

Calling all spin doctors We have a national emergency. Nerds have an image problem.

OK, quit laughing.

This is serious stuff from a task force of researchers (who are probably also nerds) that has called for a national publicity campaign [CW, Jan. 12] to polish the dorky image of computer programmers and other IT professionals.

The argument goes that students aren't flocking to computer science degrees the way they did a decade ago, apparently out of fear for their social lives. That

dilemma is draining the talent pool and aggravating the high-tech labor shortage.

Did I say shortage? That's too tame. It's a crisis. Ask the Information Technology Association of America, a trade group that claims there are 350,000 unfilled high-

tech jobs — roughly 10% of IT jobs at U.S. companies. High-tech recruiters (surely nerds themselves) are having creative convolutions trying to find acceptable candidates. There's certainly no shortage of recruiters, who in some cities may outnumber IT folks.

Enter Norman Matloff (very likely a nerd), a professor of computer science at the University of California, Davis. He takes quite a contrarian view, daring to suggest that this whole labor shortage gig has been wildly exaggerated (see "Professor questions IT labor shortage" at our Web site, www.computerworld.com).

The professor's coherent counterargument is that the shortage is really the result of overly picky hiring practices that focus on just three classes of employees: recent college graduates, foreign programmers and over-35 IT pros, who are being shunned by employers seeking cheaper labor and unwilling to retrain new hires.

So how real is the emergency in high-tech hiring? Only the spin doctors (definitely not nerds) know for sure.

Cartoon wasn't appreciated

AS SOMEONE who is open-minded enough to have used Novell, Windows, DOS, OS/2, and Apple, I resent the snide implications of your Nov. 24 editorial cartoon. It implies that anyone who talks against Microsoft is a religious bigot, that there is no rational position in favor of alternative products and that only a narrow band of zealots is dissatisfied with Microsoft's products and practices. Perhaps you should take off your Windows-colored glasses and look at the other perspective. Microsoft is led by a self-anointed band of would-be saviors. Windows is a cult.

Tom Nadeau
Dickson, Tenn.

Java statement clarified

IN RESPONSE to reader Jon McGuire's letter in the Nov. 17 issue ("Java is a language, not a religion") about my comments in a letter to Computerworld.

While it is true that I am fanatical about pure Java, the statement Mr. McGuire attributed to me is far from the truth.

I never said "Microsoft-licensed Java will be Windows and ActiveX, which is not what the public wants." I said a Java system that doesn't fully implement the facilities and APIs of the Java specification, as set forth by Sun, would then be "Windows and ActiveX," which is not what the public wants."

As to which vendor could implement such a system best, I'd have to agree with you. I thought Microsoft would be best suited. It's too bad they didn't seem to be up to the task.

Dan Packer
Jefferson, Mass.
dpacker@terracom.com

Writing counts

Peter G.W. Keen

Welcome to another year of paper as the main medium of information exchange. Long may it remain so.

I should be an easy sell for electronic anything and Web-based writers. My laptop is an almost permanent extension of my hands. PowerPoint and I have an intimate friendship. E-mail has quite literally changed my personal life by bringing me back in contact with friends and family.

But I will stick with paper. Paper works. Why?

I like paper. It's so user-friendly — magazines that are portable, books you want to introduce to all your friends, faxes and photo-

copies you can huddle over with a colleague. Instead of creating the paperless office, word processing has been a boon to paper makers. How many trees die in vain because we reprint documents? It's also the base for communication about IT. Go into any large bookstore, and you'll see rows of books about the Inter-

net, multimedia, Windows, Java and so on. In my local Borders bookstore, the IT section is the largest single subject area.

The main reason I prefer paper to the Web and other electronic media is that it attracts people who can write.

But the main reason I prefer paper to the Web and other electronic media is this. It attracts people who know how to write. The many skilled people in electronic publishing, webzines and multimedia don't as yet have a professional writing tradition or a style of writing for their new media. Many of them don't see the need for writing.

Writing is a difficult craft. Somerset Maugham said, "There are three rules for writing a novel. Unfortunately, no one knows what they are." Writing is about "voice" — giving readers a sense you are speaking directly to them. It's about mood, pace and organization. It's not just about words.

In the IT field, there are words everywhere, such as 800-page manuals for Microsoft Word. The Internet is a supermarket filled with words where you need Yahoo and AltaVista to find a needle in an infinity of wordstacks. But I don't connect with those words, no matter how multimedia embellishes them. Those words don't speak to you. In many instances, they don't respect the rules of written communication, such as

providing punctuation that clarifies meaning. Most writers online clearly have no editor. In all the books I have written, I estimate that the editing process was at least as long as the writing process. For this short Computerworld article, I will get and respond to at least two e-mail messages asking for clarifications and suggesting improvements.

Why? Because writing matters.

It should matter to 15 people, too. You wouldn't voluntarily stay and talk to a cocktail party bore. You don't stay with an electronic bore. Bad writing — as you'll find in most software manuals — is like being stuck with a cocktail party drunk.

The Internet and intranets have been driven by people who are not exactly famed for their verbal and written communication skills and interests. They mostly come out of the analytic disciplines of computer science and engineering. They have a wonderful passion for technology, but not for writing. The next era of "Life on the Internet" should be driven by people who have a passion for communication.

So liberal arts majors of the world, unite. Your time is coming. Graphic arts experts — you know how to design Web sites. History students — you can organize complex written material. English literature graduates — we hold words as the currency of human interaction and shared understanding. IS needs us. □

Keen is the author of *The Process Edge: Creating Value Where It Counts* (Harvard Business School Press). He can be reached at peter@peterkeen.com.

What makes E-mail worth forwarding?

Michael Schrage

While I was helping a friend draft an online proposal on her PC, she received a very lengthy and (ultimately) very funny joke via E-mail. We read it, laughed and then both blurted out, "We should send this to Richard." So we did.

We sure hope Richard liked his joke. Lord knows, most of the E-mail humor I get shouldn't have been conceived, let alone forwarded. That got me thinking. One of my first Computerworld columns explored "bozo filters" — those software applets designed to blot out the peevish messages and mutterings proffered by online bores and spammers. The practice and politics of who bozo-filters whom says a lot about an organization. Do you know who's bozo-filtering you?

But the joke we sent Richard made me wonder about the bozo-filter opposites. What about the messages and mail that get forwarded? Who tracks them? Just as it's revealing to know who in the organization gets bozo-filtered (the most and who uses bozo filters the most), it's useful to know who — and what — gets for-

warded the most. Is it jokes? Chain letters? cc's? Rumors? News? Memos?

If an organization really cares about the quality of its intranet communications, then those kinds of questions become more important.

The personnel manager who sends E-mistakes that two-thirds of her recipients send on to others — and then, in turn, get forwarded to another dozen people or so — is probably writing something worth reading. The woman who has the most mail in the organization forwarded to her... why? Is your organization more likely to forward a joke than an Excel spreadsheet? A rumor over a PowerPoint slide presentation?

A lot of organizations analyze their E-mail traffic. Tracking whose stuff gets forwarded and

why is far less common.

I've long felt that a miffy Ph.D. thesis would be to create a smart intranet product called "RumorNet." RumorNet would be a neural net/genetic algorithm-type package that would craft rumors — Ms. Grundy is transferring to accounting... We're going to have major layoffs... The McKinsey consultants are coming... Ted and Lucy are having an affair — and send them out on the intranet.

RumorNet would then track which rumors caught on and spread and which died on the vine. The algorithms would evolve the rumors for "fitness" and monitor the best "vectors" for effective transmission.

What inspires someone to hit "cc."? In intranet communications, these questions matter.

RumorNet, of course, would offer a terrific medium to test and explore an organization's human network. I'm sure we'll see some version of RumorNet on the market by soon.

In the meantime, organizations are missing a real opportunity to discover how they really communicate. Smart companies should explore rewarding those individuals and teams that have their smart E-mail forwarded most often — just as they should reward people whose work is most frequently cited. It's not just the intended recipients of a memo or a message who can add the most value or offer the most useful response — it can be the unintended and unknown recipients who can make the biggest difference.

Ask yourself. Are you being forwarded the right messages? Are you being creative in what you are forwarding? That's not a joke, and it's not an idea to be bozo-filtered, either. □

Windows NT® is indeed a wave sweeping the world. And no one has more experience with NT than Compaq. Today, we have more

customers as many servers running NT as any other computer company. And in less than 12 months, here, we've become the leading provider of NT workstations. From desktops to workstations to beyond, Compaq offers a complete line of products and individuals with a proven track record. Microsoft® has proven our performance on the ground. And we're committed to reducing cost and risk simultaneously. Compaq is the world's leading provider of Windows NT solutions.

Finally, something for your closet that will always be in fashion.

The SmartSwitch 6000 wiring closet switch.

- LAN/WAN/ATM from one platform
- Distributed switching and management for maximum uptime
- Layer 3 switching, broadcast control, per-port RMON, port mirroring and port trunking
- High-speed uplinks without sacrificing port density
- Scales to throughput exceeding 2,000,000 packets per second with bandwidth exceeding 3.2 Gbps
- Plug-and-play for easy setup

The SmartSwitch family—including solutions for the data center, wiring closet, workgroup and branch office—supports all your converging voice, video and data applications. And a forward-thinking design ensures they'll be hanging around for the long run. They're the simple, reliable, cost-effective solutions for your business.

Rating severance pay

Senior-level managers and officers displaced by computer companies received an average of more 1.6-month severance pay for every year of service, among the lowest levels reported by industries nationwide, according to *Manpower Personnel International*, a Philadelphia-based consulting, in contracts, lead-off benefits and severance officials received two weeks of pay for every year worked. The survey was based on 460 U.S. companies.

Georgia Crown system

Georgia Crown Distributing Co., a Columbia, Ga.-based distributor of spirits, wine and beer, has purchased software from JBA International Ltd., in Rolling Meadows, Ill. The System 21 software will provide integrated systems that will replace existing beverage distribution software. Terms weren't disclosed.

Viasoft buys in to 17X

Viasoft, Inc., an asset management vendor in Phoenix, has acquired Erisoft Technologies, Inc., a Calgary, Alberta, provider of your 2000 assessment and analysis software for desktop environments, for \$7.75 million cash.

Heart monitor project

The Mid America Heart Institute has installed a 128-channel Networked Monitoring system from Tustin, Calif.-based VitalCom, Inc. that will allow it to continuously monitor patients' heart rhythms from a centralized station. The institute is located at St. Luke's Hospital, a 440-bed teaching hospital in Kansas City, Mo.

Recruiter drives automation project

► System yields \$1.2M savings over two years

By Thomas Hoffman

CAROLYN SCHNEIDER, a college theater major, became the unlikely heroine in a human resources automation project that saved her company more than \$1 million.

When Schneider, 39, joined Orinda HealthCorp as director of executive recruitment in July 1993, the Nashville-based manager of acute care hospitals had no way to track job applicants at 50 hospitals.

Having orchestrated the installation of an automated recruiting system at HealthTrust, Inc., her former employer, Schneider began lining up her ducks for a rollout of a new

system at Orinda. She planned to use human asset management software from Resumis, Inc., in Sunnyvale, Calif.

Schneider had senior management's blessing to install the system before she started working at Orinda. But once on board, she quickly found resistance from the company's information systems department. Orinda's IS group didn't support Unix and told Schneider that it couldn't support the Resumis system.

"But I knew I could" get the system installed, she said.

So Schneider hired Resumis to install the system. After working with the system on a daily basis since it went live in

Orinda's Carolyn Schneider

The company's IS department resisted installing the Resumis system, so she did it herself.

January 1996, Schneider said she learned enough about Unix "by osmosis" to become the Resumis system administrator.

"I'm a right-brainer. I'm a

theater major, but I can get in [Unix] and get by with the best of them," Schneider said.

It's a good thing for Orinda that she did.

SIGNIFICANT SAVINGS

Thanks to a system that automatically matches job openings with information from a database of applicant resumes, Orinda was able to knock more than \$1 million off its annual recruiting costs in 1996. From \$2.3 million to \$1.3 million Schneider said.

As the end of last year approached, Orinda was on track to slash another \$275,000, or 20%, from its recruiting budget, Schneider said. That isn't a shabby return for a \$100,000

Recruiter, page 44

• Office facilities, location as recruiting tool

Firms spruce up work space to lure IT talent

By Tim Ouellette

WHEN COMPETITIVE salaries and benefits aren't enough to attract scarce IT workers, some companies are prepared to create a positive work environment any way they can.

The Lahey Hitchcock Clinic, in Burlington, Mass., for example, used a completely new building as a tool to attract

information technology staffers. The idea was to promote the notion that more work space can mean a more creative and enterprising work environment.

As a result, the new facility is expected to provide the IT department with more space — and more opportunity — to quickly boost its programming staff from 42 to 52 workers.

Firms spruce up, page 44

Companies such as Lahey Hitchcock Clinic are giving IS staff more elbow room with new cubicles and team-oriented work spaces.

Health care organization heals IS wound with NCs

By Randy Weston

IMAGINE THIS IS support and maintenance scenario: Your company runs 235 nursing homes and long term care facilities spread across 25 states from Florida to Hawaii. Each site runs DOS-based applications on PCs that facility directors and nurses must support themselves. And an aging mainframe with a serious year 2000 problem supports your

headquarters in the remote location of Sioux Falls, S.D.

Welcome to the information systems nightmare of the Evangelical Lutheran Good Samaritan Society, Inc.

NO SUPPORT

"It's driving us crazy trying to keep up with maintenance and support, and we don't have technical people in these centers," said Rusty Williams.

NCs, page 44

Organization turns to NCs

CONTINUED FROM PAGE 41

chief information officer at the \$750 million nonprofit organization.

"We're asking directors and nurses to take care of applications. We are taking away from their focus, which is serving the patient," he said.

The 75-year-old society is turning to a network computing architecture to solve its problems.

Once the project is completed, the organization's core financial, human resources and other operation management applications will run on a central server in Sioux Falls. Nursing homes and other sites will access the applications through World Wide Web browsers on 1,000 to 1,500 IBM network computers.

RISKY BUT NECESSARY

It is a pretty forward-thinking and relatively costly plan for an organization founded by a Lutheran minister affectionately known during his time as the Rev. August "Dad" Haege. Williams said the two-year project has a \$10 million budget.

But it is the only answer Williams' office could adopt that would allow Samaritan's directors and nurses to stop being IS managers and return to being caregivers to the society's 38,000 elderly and disabled residents.

"It's pushing us closer to the bleeding edge than we'd like to be," Williams said, referring to a relatively new system that uses network computers and applications based on the Java computing language.

"It's driving us crazy trying to keep up with maintenance and support, and we don't have technical people in these centers."

— Rusty Williams, CIO, Evangelical Lutheran Good Samaritan Society

Doug Lynn, an analyst at Meta Group, Inc., in Stamford, Conn., warned that users who decide to run applications from central servers using wide-area networks and network computers will have to make sure they have enough bandwidth and back-up networks to handle the load.

"The reduction of this clients and Web browsers is great, but you have to consider that network availability is mission-critical," Lynn said. "People say the network is always there, but if it goes down, then users are left high and dry."

The society is building its own proprietary frame-relay system to meet its needs.

Williams said an IBM RS/6000 SP server will be used at the Sioux Falls headquarters to run a suite of financial and human resources applications from Lawson Software, Inc., in Minneapolis.

His office is shopping for a suite of niche health care software products to also fit into the fold. And approximately 1,000 to 1,500 IBM network stations will be installed across the company to access the applications using Web browsers.

YEAR 2000 ISSUE

Hastening the project is a looming year 2000 problem. The current system, an aging 486 IBM mainframe with home-grown DOS-based applications running on PCs at the facilities, has less than two years of life left in it. The organization expects to save 60% to 70% on maintenance and support costs when the project is done.

Williams said Samaritan plans to roll out human resources applications in the spring.

Financial applications are set to follow in July, with all the centers up on the core applications by year's end. The niche long-term care products are to be up and running by the end of next year. □

Firms spruce up work space to lure IT talent

CONTINUED FROM PAGE 41

said Anne Fitzgerald, Lahey's director of IT at the health center.

That's because space was so tight in the old facility that some IT staff had to work in the basement of the nearby hospital building. Though the expansion was done to free up existing clinic staff from those tight quarters, the result could be very positive for Lahey's IT recruitment efforts.

"Recruitment would be easier now. The previous building was a real turnoff to incoming candidates" because it was so cramped, Fitzgerald said. "Now the building gives both existing employees and prospective workers a sense of commitment from the company."

MANY THINGS THIS

Lahey isn't alone in this type of effort. At a time when companies are competing hard for fewer IT professionals, such a change of address could be an important carrot for technical recruiters to wave.

"In some cases, we have even seen companies that get the reputation of being a sweatshop," making it hard to get new or contract employees in there, said Betsy Schroeder, a technical recruiter at Interactive Business Systems, Inc., in Dallas.

"In general, we see companies trying to change their environment and upgrade their facilities as a way to attract staff," she said.

At Lahey IT was one of three divisions that moved into the building in October. Company officials said it has all the amenities of modern office complexes.

The clinic is already promoting the new building in recruitment ads, saying it has "opened up the room to expand our information technology area" and that employees will have more "freedom, resources, support and opportunity" to do their jobs.

GOOD RESPONSE

The response has been "incredible," said Carol Yellen, Lahey's technical recruiter. Previously, "when I brought people through the other facility I could almost feel their stomachs turn," she said. "Program-

mers would like to have their own space instead of a desk in among a bunch of people."

That's why Fitzgerald and her staff helped design the new IT work space, including room for things they didn't have before such as separate cubicles, a reference library and printing areas.

More than 70% of large companies are building open and shared workspace areas into their office plans in an effort to keep and attract employees, according to a report by Knoll, Inc., an office design firm in Boston.

"In general, we see companies trying to change their environment and upgrade their facilities as a way to attract staff."

— Betsy Schroeder, technical recruiter, Interactive Business Systems

For example, when Word Wide Web design firm Digit Interactive wanted a new headquarters, it didn't want to locate near other high-tech firms in the Ottawa suburb of Kanata.

THE RIGHT IMAGE

Instead, "we went on an extensive search when planning for our new headquarters," said Nathan Rudyk, managing partner and president of the company, which is based in Ottawa.

"We wanted to find the place that projected the image of our company. With a young Web company, that is the downtown area," he said.

That means the office is closer to the city's artistic and multicultural neighborhoods that offer the best IT staff for Rudyk's business.

"You have to take a look at your potential recruits and tailor the work environment to attract them," Rudyk said. □

Recruiter drives automation project

CONTINUED FROM PAGE 41

investment in software and hardware, including a Sun Microsystems, Inc. Ultra server.

Schneider said she tried to help Orada's IS department understand the rationale behind the Resumis system and what it could do for the company.

Schneider ended up acting as a liaison between the recruitment department and Resumis to help answer questions the IS department had about the impact the system would have on Orada's network.

That helped Schneider reduce her department's reliance on IS to support the system, which in turn helped smooth her relationship with the group.

The bulk of Orada's IS department and operations have since been outsourced to Prest

Systems Corp., in Dallas. Electronic Data Systems Corp., in Plano, Texas, and Systems Management Specialists, in Santa Ana, Calif.

ADDITIONAL FEATURES

Online systems such as Resumis and ResTrac Hire from ResTrac, Inc., in Dedham, Mass., are not only good at tracking applicant resumes that have been scanned or faxed into the system, but they can also help corporate recruiters identify talent from within by matching experience with job openings, analysts said.

The search-and-match capabilities of software such as Resumis can help companies fulfill "the dream of finding the rocket scientist in your janitor,"

said Mark Huey, an analyst at Meta Group, Inc., in Stamford, Conn.

Santa Barbara, Calif.-based Tenet HealthCare Corp. acquired Orada in January of last year, and the new owner was impressed enough with Orada's Resumis payback to begin rolling out the system in its Dallas operations center and piloting it in New Orleans.

Mike Duda, manager of recruitment at Tenet HealthCare System in Dallas, said he has high hopes for the Resumis system.

"It's impossible to keep track of individuals with desirable skills, so the system should help us cut down on recruiting time by making those matches for us," Duda said. □

Build community, build a market

► Tripod.com among busiest sites on the Web

By Sharon Machlis

EVERYBODY KNOWS what is popular on the World Wide Web. Cable News Network, USA Today, The Weather Channel, Tripod, Inc.

Tripod? Yes. The 50-person company nestled in the Berkshires Mountains town of Williamstown, Mass., is playing in the Internet major leagues, thanks to a strategy that targets the hot 18- to 34-year-old demographic group, among the world's most Web-savvy. Tripod.com now consistently shows up on lists of the top 20 most-visited sites.

Web-rater RelevantKnowledge, Inc. said Tripod was the 15th most-visited site in December, with more than 2.3 million individuals checking in at least once, edging out CNN, Amazon.com, Inc. and Time, Inc.'s Pathfinder.com, among others. Tripod said it has more than 860,000 members and 1.4 million member-created pages.

"Generally, they've been pretty successful in terms of online promotion," said Patrick Keane, an analyst at Jupiter Communications, Inc. in New York. And mainstream advertisers have taken note.

Launched in April 1995 as an information resource for young Tripod, page 50

Don Zeraski and Margaret Gould-Stewart said helping Gen-Xers build personalized spots on Tripod's site drew a bigger, more loyal audience than they expected

E-commerce driving security push

► SET protocol put on view at conference

By Laura D'Addio
San Francisco

USER DEMAND for secure electronic commerce drove cryptography vendors into a frenzy of alliances and new product announcements at last week's RSA Data Security show here.

Users want to secure voice, data and electronic-commerce applications over the World Wide Web.

"Cryptography has been around for over 20 years, yet we've seen little in the way of technical advances until now; it's really still in its embryonic stage," said Carl Howe, director of network strategies at Forrester Research, Inc. in Cambridge, Mass.

But the demand to do business over the Internet is changing all that.

(SET) 1.0 protocol, which will let businesses scramble sensitive data such as credit-card and account numbers. Version 2.0 of the SET standard has been available for about two years; the 1.0 specification is slated for

completion this spring. At least a dozen vendors are readying SET 1.0-compliant products to market late this year. Also, much in evidence was a new form of cryptography called "net security," page 50

Groupware gives lift to Reebok site

By Barb Cole-Comolisi

REEBOK INTERNATIONAL LTD. has turned to collaboration software to transform its World Wide Web site into an interactive experience and keep its customers coming back. Along the way, it has reduced the hassles involved in updating the ever-changing contents of the site.

The Stoughton, Mass.-based sneaker and sports apparel manufacturer recently redesigned Reebok.com using Radnet, Inc.'s WebShare, a Web-based groupware system. Reebok is using the built-in electronic-mail hooks, discussion groups, bulletin boards, and E-mail postcards to make the site far more interactive than when it debuted in 1994, according to Marvin Chow, Reebok's director of interactive marketing.

The goal was to create a Web Groupware, page 50

Visitors to Reebok's site can get customized workout tips and news updates about sports they are interested in

Site gets interactive lift from groupware

CONTINUED FROM PAGE 49

site that fostered a community of users, Chow said. "If you just try and use the Web to sell them products, something is missing," he said. Reebok.com gets about 800,000 hits per day, and the company has signed up about 25,000 site members.

Reebok currently offers four microsites, each devoted to a particular fitness category, where customers can get profiles of athletes and training tips from coaches. But visitors who fill out a profile form in which they list their favorite sports will get customized workout tips,

news updates about their sport and other information on future visits. Site members also can send e-mail postcards to their favorite athletes.

A Java-based sports ticker component that will let Reebok push game scores and sports stories to visitors is also in development.

"Delivering customized content via Web sites is still pretty rare but extremely valuable to companies like Reebok that sell to a mass market," said Mark Cecere, an analyst at Giga Information Group in Cambridge, Mass. It is particularly key for Reebok, "which is probably marketing to a younger audience that is looking for a fair amount of glitz," Cecere said.

Though Chow envisions customers chatting online with the large stable of athletes who have endorsed Reebok's products, built-in groupware isn't the primary reason WebShare got the nod.

Instead, it was the capability for Reebok employees to update the contents of a Web page—for example, modifying the address of a distributor or adding a recent interview with a sports figure—using a Web browser. And the workflow features in WebShare help Reebok manage the contents of its site, ex-

plained Jim Burke, president of Mindsey Technology, Inc., the Boston-based consultancy that designed the site. Reebok's marketers can update information and pass those changes to the appropriate people automatically by using a workflow engine. Previously, updates to the site had to be coordinated through Reebok's Internet service provider.

The kind of do-it-yourself updating that Reebok now enjoys is one of the main advantages of using a Web-based collaboration platform such as WebShare or Lotus Development Corp.'s Domino as the basis of a Web site, Burke said.

WebShare better fit Reebok's needs than Domino because Reebok wanted to integrate its site with existing databases, which house information on products and retail outlets. WebShare works in conjunction with an SQL database, whereas Domino uses its own proprietary object store.

Scalability was also an area where WebShare seemed better suited. Using WebShare, Reebok was able to distribute its load across 16 Sybase, Inc. SQL Server databases without having to use a gateway that would have been required with Domino, Burke said. □

'net security

CONTINUED FROM PAGE 49

typical curve, which will let businesses encrypt data on small, storage-constrained consumer devices such as cellular phones and handheld devices.

Today, most organizations that do business electronically use the Secure Socket Layer (SSL) protocol to scramble their Web-based data transactions while the data is being transferred. But SSL can't encrypt the actual data once it arrives at its destination. "SET 1.0 will give us and our customers a higher degree of encryption at the application level by safeguarding account numbers and credit transactions from potential hackers," said Ed Elhrigot, director of internal audit at Charles Schwab & Co.

The San Francisco-based discount brokerage has more than 12,000 internal users. It handles more than \$400 billion in assets from a million active customer accounts worldwide. "We will not wait, though, to make sure all the kinks are out before we implement it," Elhrigot said.

ALL IN ONE PLACE

William Sztabnik, a vice president and director at Citicorp International Communications, Inc.'s global security resource center, said the conference, sponsored by RSA Data Security, Inc., is a good place to monitor trends and next-generation security devices. "This is the one time all year that I get to see all my vendors at the same time and argue the merits of the various technologies and standards initiatives," he said.

Citicorp's biggest security challenge is finding and deploying encryption products that will work with its diverse applications, operating systems and hardware. "There is no such animal right now, and that makes life tough for myself and my administrators. We expend a lot of time and energy just to come up with some that works OK but isn't necessarily bulletproof," Sztabnik said.

David Ferris, president of Ferris Research, Inc. in San Francisco, said, "Less than 5% of Fortune 500 users are investing in encryption technology for Web-based transactions right now or are even implementing test networks. Everyone's playing a wait-and-see game because Java technology is still too young and raw to handle most applications, and there's not a lot of cryptography solutions being sold yet." □

Tripod site draws Gen-X hits

CONTINUED FROM PAGE 49

people about everything from money to relationships. Tripod soon posted tools for visitors to create their own pages on the site. The explosive growth of personal Web pages has been the single biggest surprise at Tripod, company officials said.

"I don't know if at that time we understood the magnitude of what we were doing," acknowledged Margaret Gould-Stewart, company producer and creative director. "At that time, personal publishing was even before its infancy."

Tripod executives credit their site's popularity to its fulfillment of the twin Web mantra of creating virtual communities and offering personalized experiences.

FLIPPING FOR FLIPPANCY

Tripod.com has a breezy, flip-pant tone befitting its core Generation-X audience. It's hard to imagine CNN's site editor posting a letter like the recent missive from Tripod editor Emma Jane Taylor that begins, "I have

a confession. At the grand old age of 22, I have succumbed to a girly crush on a movie star."

Surfers at Tripod are encouraged to become involved with quick surveys such as "Do you have a personal space bubble?" (Possible answers: "Of course I do!" or "Excuse me?"), chats, message threads and member pages. Templates were designed to make it easy to post everything from a complete site to, say, favorite recipes.

"We're trying to make it easy for people to interact with the site on a number of different levels," said Don Zerefski, vice president of technology.

Tripod has 33 interest areas, called pods, on subjects such as work, home life, health and women's issues. Tripod visitors can register for free membership, allowing them add bytes of server space for a Web page.

The Tripod audience is one typically lusted after by many mainstream advertisers: young people in their brand-loyalty formative years. The company said it has signed up a stable of

Tripod.com has 33 interest areas, or "pods"

blue-chip advertisers, including Chrysler Corp., Ford Motor Co., Columbia TriStar and Fidelity Brokerage Services, Inc.

And Tripod collects revenue from users who sign up for "premium memberships," which offer 12M bytes of server storage, a personal chat channel and electronic mail forwarding, among other features, for \$5 per month. Company officials expect electronic commerce to become increasingly important as Tripod looks to brand some Web vendors a crack at its tantalizing Gen-X crowd. Zerefski

said the site expects to be profitable by the end of this year, although he wouldn't estimate revenue.

Several other major Internet players are eyeing the home page hosting arena, and Tripod is likely to face more competition down the road.

"We've heard that a number of folks are moving into that area," Zerefski said. "But we're far more than a repository of home pages. . . . People will want to come back because they're left a piece of them selves at the site." □

Oracle
is making news
in more ways
than you think.

CNN.com/customnews

When news happens around the world, people turn to CNN. And when CNN needed someone to run their Custom News site, they turned to Oracle. Oracle Application Server, Oracle Data Server and Oracle ConText® enable CNN Custom News to deliver dynamic content in real time, so millions of users around the world can access

Overseas nets pose challenges

By Bob Wallace

SETTING UP an office overseas is one thing. Setting up a network overseas is another.

Seasoned information systems managers want trying to set up local networks to support a new business overseas means problems finding qualified resellers and a shortage of skilled staff.

Addressing those challenges will mean more work for IS managers, often heavy international travel and even possible relocation to support a corporate move into foreign markets. "Where international branch offices provided a terminal for a mainframe connection [to the U.S.] in the past, they're just

"Users should look for a global VAR based in the U.S. that has enough skilled support staff in the countries in which you want to set up shop."

—ROBERT MCKENNA
SUN MICROSYSTEMS

now starting to support the same network applications as we are and require the same set of [local] network tools and technologies," said Tom Nolle, president of CIMI Corp., a Voorhees, N.J., consultancy. "As

international business becomes more important, IS managers are being forced to confront this problem.

The toughest part of bringing these offices up to speed is selecting the right value-added re-

seller (VAR), users said. That's important because most U.S.-based LAN vendors don't deal direct overseas.

"Users should look for a global VAR based in the U.S. that has solid network design experience and enough skilled support staff in the countries in which you want to set up shop," said Robert McKenna, vice president of global network engineering at Sun Microsystems Capital Markets, Inc., in New York. "Once you start dealing with individual local VARs overseas, things can get difficult to coordinate."

Checking out track records is the key to picking the right VAR, said Chuck Bush, the right

Cleaning up LANs for year 2000

► Systems management app helps agency prepare

By Patrick Dryden

ONE AGENCY in the state of Washington already has identified which of its PCs and LAN applications will choke in 2000. Now the tough part is removing them.

Information systems planners in the private sector typically assume that the natural replacement process will assure year 2000 compliance for all distributed hardware and software before the new millennium.

For example, Phoenix-based U-Haul International, Inc. expects to turn over most of its desktop PCs, said Mark McCarrick, supervisor of PC support. "We have about a hundred 286/386 machines still in the office here, but the goal is to just get rid of them," he said.

But PCs and LAN-based programs never really leave the 3,000-user state Department of
Cleaning up, page 57

MCI dominates local service

By Matt Hamblen

DESPITE AT&T CORP.'s planned merger with local carrier Teleport Communications Group, analysts and users said MCI Communications Corp. is far out front in the race among long-distance carriers to add local service.

MCI now has local voice and data service to businesses in 31 metropolitan U.S. markets, giving customers the ability to hire MCI for both long distance and local service. AT&T offers limited local service.

"We've started to migrate to all local business with MCI in

By adding MCI local service, users may get:

- Integrated billing for local markets with long-distance service
- Management reports of calling patterns
- Alternative to regional Bell provider

those areas where we aren't happy with local service from the Bell operating companies. MCI gives us one-point service [for long distance and local] and

good pricing," said Mike McLeod, vice president of operations at Sotomai Management Corp., in Westlake, Texas, which operates and franchises electronic security services for 100,000 businesses.

SERVICE ISSUES

McLeod said he received good service and pricing from Bell South in Atlanta and Southwestern Bell, part of SBC Communications, Inc. in San Antonio. But he was relieved to cancel his local service from US West, Inc. in Denver and Pacific Bell, which is also part of SBC.

MCI, page 57

Cisco gives its switches a bit more sensitivity

By Bob Wallace

NETWORKING GIANT Cisco Systems, Inc. last week announced a family of flexible switches that will let IS managers automatically accommodate increases in bandwidth requirements by end users.

The Catalyst 3500 XL desktop switches can provide 10M or 100M bit/sec. bandwidth from each port. The switch automatically "senses" when a

desktop needs more capacity and switches to the higher speed.

That gives information systems managers an alternative to replacing 10M bit/sec. systems with higher-speed switches when end users outgrow their 10M bit/sec. connections. Bay Networks, Inc. and 3Com Corp. offer similar systems.

The cost difference between 10M/100M bit/sec. switches and 100M bit/sec.-only switch-

es is negligible, according to The Dell'Oro Group, a Portola Valley, Calif., research firm.

NO DRAIN

"With autosensing switches, there's no requirement for management reconfiguration," said Tom Nolle, president of CIMI Corp., a Voorhees, N.J., consulting and research firm. "That means there's no drain on network support personnel."

Autosensing, page 57

SLA ON THE WAY

61% of network managers expect to establish service-level agreements (SLA) by June 1999 to track usage and uptime of servers and networks for corporate management.

Quality means dependable and reliable – ready, willing and able to go above and beyond. That's GATEWAY™ products and Gateway 2000 Major Accounts, Inc. services.

Gateway's comprehensive product line provides the perfect solution for your entire organization. Whether you need low-cost desktops, powerful workstations, modular portables, group-computing digital media computers or scaleable servers to tie your network together, Gateway has the total computing solution.

But what good is a full breadth of product

without the knowledgeable staff to back it up? Gateway sales representatives are specially trained to handle the unique needs of our business customers. With Custom Integrated Services (CIS), a host of hardware and software applications can be custom-built into your PCs. And your representative will continue to work with you to design computing solutions to meet your changing needs.

That's quality service, with quality Gateway products. Custom-configure your PCs on our Web site, or give our sales representatives a call today. Let them personalize a total PC solution for your organization.

(For more information on our full product line, just give us a call or visit our Web site.)

Overseas nets pose challenges

CONTINUED FROM PAGE 53

network architect at McDonald's Corp. in Oakbrook Terrace, Ill. "We've found that the level of VAR training varies widely, as many VARs are new and untrained," Rush said.

The fast-food giant operates in more than 100 countries, including Eastern Europe and Russia.

VARs that are LAN equipment experts are hard to find, he said. That's largely why, two weeks ago, Rush moved his family to London for a two-year stint.

"I was spending all my time in Europe," Rush said. "I'd be over there for five or six weeks straight and then back home for one week. It was becoming a strain, and relocating made more sense."

McKenna reached the same conclusion several years ago, moving to Hong Kong for two months to help alleviate a skills shortage before Sumitomo opened an office there.

"We didn't see it in London, but in Asia we found a serious shortage of experienced design and engineering workers," McKenna. "As a result, our crew took on those tasks, which tied up a good amount of resources."

Polaroid Corp. has turned to employees in its small international office to help address the problem.

"We try to get a 'power user' at the site to take on responsibility for ongoing network support," explained George Deyett, telecommunications operations

manager for the Waltham Mass.-based camera and film producer. "We simplify our network design to help keep things simple for the person."

The firm ships equipment that supports remote diagnostics so Polaroid's staff here can troubleshoot and isolate problems, leaving the power user to just fix them, Deyett said. He said the success of the strategy varies by site. "These power users already have regular jobs, so there can [still] be resource constraints," Deyett said.

Polaroid has small offices in Italy, Switzerland, Belgium, Austria, France, Germany and Australia. The firm has on-site support staff in its larger international manufacturing facilities, Deyett said. □

MCI dominates local service

CONTINUED FROM PAGE 53

"Some [regional Bell operating companies] are good, and some are miserable," he added.

Synacor International Corp. in Woodland Hills, Calif., recently picked MCI for local service over Pacific Bell when it decided to move its corporate headquarters. MCI offered Synacor one of the same telephone numbers from its old headquarters, while Pacific Bell wouldn't.

MCI also provides management reports on local service as well as long distance, identifying the company's heavy calling periods so it can adjust customer service staffing levels as needed.

"The RBOCs are now going to have to show a higher service

level" to continue to compete locally, said Jay Saporta, communications manager at Synacor.

Analysts said MCI clearly is out front in local service to business. "MCI has by far gotten the earliest start and has invested the most with fiber-optic cable and switches in 31 cities," said Rob Rich, an analyst at The Yankee Group in Boston.

THE PAYOFF

Jeffrey Kagan, an analyst at Kagan Telecom Associates in Atlanta, agreed that MCI is dominant. But MCI has made a heavy financial investment in building infrastructure that hasn't yet adequately paid off in increased revenue, although it

probably will, he said.

AT&T's recent announcement that it will merge with Teleport Communications in Staten Island, N.Y., in an \$11 billion stock deal shows a strong surge by AT&T to develop the local market for business users, Kagan said.

But MCI, which plans to merge with WorldCom, Inc. in Jackson, Miss., will be able to reach more business customers than AT&T/Teleport, Kagan said. MCI/WorldCom will have a presence in 90 local markets, and AT&T will be in about 66 markets, he said.

"MCI is way out in the lead but could be sluggish if not with AT&T in two years" as AT&T grows and adds markets for local business services, Kagan said.

The third-largest long-distance provider, Sprint Corp. in Kansas City, Mo., hasn't yet entered the competition for local service that is bundled with its long-distance offering.

Competition at the local level is a priority for network managers. Kagan and Rich said. Business users frequently say they dislike having only one choice of carrier in most markets.

Nationwide, only 5% of the \$100 billion local market is held by companies other than the regional Bell operating companies, Rich said. □

PREPARING PCs AND LANs FOR 2000

Some check-side tips from the Department of Labor and Industries, Washington state:

Start soon — Fixing or moving PCs and replacing programs may take longer than you think

Test everything — Screen all hardware, software and user procedures, and don't accept vendor claims

Get ahead now — Hardware inventory and software metering are good for more than year 2000 projects

Cleaning up LANs for year 2000

CONTINUED FROM PAGE 53

Labor and Industries in Olympia, Wash., which handles worker compensation and safety issues.

Date problems that crop up here might affect claims payments, for example — even though the agency will have fixed year 2000 processing in its mainframe applications.

"As a state agency, we don't throw away anything," said Gordon Swarthout, technology asset manager at the agency.

Fewer than one-fifth of 15 groups have completely inventoried their PCs and software, said Chris Germann, an asset

manager at the agency. The agency needed to ferret out noncompliant systems. NetGenesis software from Tally Systems Corp. in Hanover, N.H., tracks specific configuration information such as the type of processor and support chips. After lab tests identified noncompliant configurations, NetGenesis spotted them in its database. A simple upgrade to BIOS chips can fix 120 of these PCs. Swarthout said, but modifying the rest will be too costly. So labels and warning flags in NetGenesis will have to steer those systems away from interacting with critical applications.

Software was tougher to find and fix.

"Seemingly small, inconsequential programs like macros spread from one to a few to hundreds of users, until the agency and public come to rely on them," Swarthout said.

Another Tally Systems tool, Centimeter, quickly reported which software users run so the lab would know what to test. But testing required about 300 hours in the agency's lab, Swarthout said. And it would have taken longer without help from other state agencies, he added. Each tested some common packages and shared the results.

But testing may not be the hardest part. Replacing familiar software may take until the end of the millennium.

Back when the agency migrated users from DOS to Windows, many endured a "painful process" that took two years before every database process, word processor form and spreadsheet macro was changed. Swarthout said. □

Autosensing switches due

CONTINUED FROM PAGE 53

Support staff today get tied up with mundane tasks such as reconfigurations and "are often never able to sit back and look at network trends and strategic issues," Nolle said.

"That's why so many users stumble into problems with their networks," he explained. The Cisco switch family comprises four models.

The eight-port Catalyst 2508 XL costs \$2,295, which is \$497 per port.

The 16-port Catalyst 2516M

costs \$3,995, which is \$350 per port. Both are available now.

In March, Cisco will ship the 24-port Catalyst 2924 at \$1,995, which is \$166 per port, and the 24-port Catalyst 2924C at \$4,995, which is \$208 per port. All the models can be equipped with two expansion modules. The Catalyst 2924C switches can forward 1 million packets/sec. and use 1.6G bit/sec. of bandwidth. They can be managed using a World Wide Web-based interface. □

There are two ways to Build a Data Mart.

Not so smart.

Very smart.

Building a data mart projects become a nightmare because you must integrate with separate software tools from many vendors. Even the most carefully designed data mart won't work if the components haven't been designed, tested, and optimized to work together. And do you really want to build a data mart every time you have a problem? The solution is SmartMart, a data mart from Information Builders.

SmartMart provides a complete technology and methodology to build, use and manage a data mart. It's an affordable package. You get tools for data integration, environment transformation, multidimensional analysis, and more. Web access, too.

SmartMart is a complete, single-vendor solution. All components are fully tested to work together so you avoid the cost, complexities and delays associated with integrating technologies from multiple vendors. Best of all, SmartMart's architecture ensures full integration with your enterprise information systems and tools.

Briefs

Help for Bean projects

New York-based ICMAC Peak Networks LLP has launched a consulting practice for food and beverage companies that implement The Bean Co.'s enterprise resource planning software. The practice, aimed at quick implementation, will include reference models designed specifically for the industry so users can configure software and change their business processes.

Object databases

Verant Object Technology Corp. in Pleasant, Calif., this week will detail plans to bundle its object database with NetDynamics, Inc.'s Internet application server and Rational Software Corp.'s component-based modeling software. The Verant/Net package was designed for use in building Java-based applications. Pricing for its users starts at \$55,000. The product is due to ship late this month. Verant also is integrating its database with emerging software from Jibe Software, Inc., but it won't sell that product.

XML publishing

Electronic-commerce software firm Open Market, Inc. plans to incorporate the Extensible Markup Language (XML) in its future products. The Cambridge, Mass., company said XML can help deliver "more compelling electronic publishing" by enabling rich search- and compound-document support on the World Wide Web. The World Wide Web Consortium has linked XML as a Web standard.

Y2K Cabot fuel

NeosMedia Technologies has announced an upgrade to its cross-platform Cabot year 2000 test and adapt/analyze software. The upgrade is designed to provide automated source code conversion to implement IBM's newly announced millennium language extensions for Cabot. Adapt/analyze will ship next quarter. Pricing starts at \$25,000 for NT versions and \$30,000 for Unix.

Auto-install saves only in volume

By Gordon Mah Ling

HOW MUCH return on investment (ROI) can you expect using automatic software installation instead of sending a platoon of technicians armed with CDs and floppies to every corner of your company?

A new study found that large companies with tens of thousands of PCs benefit most quickly from automatic software distribution. Companies with 1,000 network nodes would have to go through five software deployment cycles before they could recover the costs of their

investment, according to the study by Federal Computer Week magazine.

Users agreed that automatic software distribution saves dollars but disagreed on how fast the ROI comes around.

"We've automated the install, and it's saving us tons," said Dan Brunner, a systems programmer network engineer at Western Washington University in Bellingham, Wash.

"Previously, we would have a staff of people go out to everybody's desks. Now we call them

Auto install, page 62

Microsoft, Sybase move to fill gap

By Craig Stedman

MICROSOFT CORP. and Sybase, Inc. don't develop databases together anymore. But both are moving at the same time to correct a shortcoming that limits their support for packaged applications.

Each company is beta-testing a database upgrade that adds row-level data locking, a key technology that users need to take full advantage of applica-

NOT-SO-HIGH AVAILABILITY

The status of key packaged applications for Microsoft and Sybase databases

Microsoft	Sybase
• SAP, Baan and PeopleSoft all support SQL Server 6.5	• SAP doesn't support Sybase databases
• But performance will be better with row-level locking, Microsoft says	• Baan has only a controlled release at this point
	• PeopleSoft supports Sybase, but speed is limited for now

Agency combines databases to revamp vital forecasts

By Sharon Gaudin

CUTTING ONE-THIRD of the staff at the U.S. Department of Energy (DOE) not only escalated the workload but also focused a glaring light on how often users were getting bad information from database queries.

Scott Appleton, information

manager at the DOE in Idaho Falls, Idaho, said the problem of getting inaccurate and inconsistent information from database queries has plagued the federal agency for years.

Maintaining high-quality queries is an important consideration for any business, but the stakes for the DOE are high. Faulty reports on government

laboratories, nuclear facilities and cleanup projects, for example, could result in fines from state and federal regulators. The department also must provide regular budget forecasts that can change with the prevailing political winds in Congress. Mistakes there could mean a loss of funding.

The agency's situation became more visible in the Clinton administration's effort to cut administrative costs across the federal government, Appleton said. The policy slashed the number of the DOE's outside contractors from five to one in 1996 and cut the agency's

DOE database, page 62

REVIEW

New Norton Win 95 utility almost gold

By Howard Millman

VERSION 3.0 of Symantec Corp.'s venerable utility collection, Norton Utilities for Windows 95, adds several performance-enhancing and preventive maintenance modules. A new interface, Systems Integrator, significantly simplifies the use of the program's many features. But Symantec could have made this a truly first-rate tool collection by including features once bundled in its earlier products.

Version 3.0 offers 15 tools to monitor nearly 20 key system conditions and processes. Chief among those new tools is WinDoctor. A worthy update of the Norton Disk Doctor, WinDoctor valiantly tries to compensate for Windows 95's weaknesses, and it partially succeeds. WinDoctor finds and fixes a host of registry problems, including missing Dynamic Link Libraries, registry errors and incorrect application paths. Run weekly; this Wizard

YOU CAN BE WIRED, PLUGGED IN AND ONLINE ► BUT WHEN YOUR MESSAGING SOFTWARE RUNS OUT OF GAS YOU WON'T DO **SQUAT**

LOTUS SCALABLE MESSAGING SOLUTIONS. This is a huge issue: will the messaging software you buy today grow with your company down the road? Or will it be a big gaping pothole that throws your whole company out of alignment? It doesn't matter how big your company is. Or how small it is. You must have innovative messaging and communications software that enables you to grow and allows you not only to add new users, but also to add new capabilities. As your company becomes more and more dependent on messaging software, this issue continues to loom.

LOTUS LEADS THE INDUSTRY in messaging and communications solutions. We offer more safe and proven choices than any other software company. From basic e-mail to the tools that let companies build massive customized messaging systems for larger enterprises. All of them web-tuned for seamless integration with the Internet (or your intranet).

But even more important, Lotus messaging solutions are designed to provide an easy upgrade path from one to another. Leverage your existing IT investment. Move easily to the software you'll need tomorrow, adding new users and new capabilities as you need them.

Common sense says that this is the way it should work. But the secret of most messaging software is that when you hit the ceiling on its capabilities, that's it. You have to throw it away and start over. The cost, the aggravation, and the inconvenience are huge. For information about Lotus messaging solutions, go to www.lotus.com/workingtogether

Auto-install savings

CONTINUED FROM PAGE 59

on the phone and say "Click here," Brunner said.

Like most users, Brunner said he can't put his finger on the exact amount of money his organization saved.

With the university in the middle of a Microsoft Corp. Office 97 rollout, Brunner said he believes the deployment to 4,000 desktops for administrators and staff spread across the 50-building campus will take two months instead of six months over a manual installation.

Washington University uses a combination of Novell, Inc.'s Application Launcher and administrative tools from Microsoft to automate the process.

"I think you break even on two using [Application Launcher]," Brunner said. "What it's done for us is not having to hire that many people. With the same amount of staff, we've been able to respond to the users' needs quicker."

TEST RESULTS

The *Financial Computer* study measured the time it took to install four popular applications and how much time a technician would have to spend babysitting each deployment.

The test then measured the cost to build installation and removal templates under Intel Corp.'s LANDesk. Manual installations beat automated installs by more than an hour. And a single automated installation cost \$49.02, far more than the \$9.37 cost of a manual install. A large portion of the cost the study estimated was the \$50-per-seat license of

LANDesk for 1,000 seats.

But the cost of LANDesk also includes antivirus, remote control and asset management, said Mark Maguire, director of information technology at Domino's Pizza, Inc. in Ann Arbor, Mich. That makes it a bargain.

Maguire said the fast-food company hasn't used LANDesk to do a full-scale deployment, but technicians use it to troubleshoot remotely and to install new applications.

The LANDesk seat charge is expensive but is "obviously the smarter way to go."

— Mark Bos
Baptist Health Care

"Looking at the money you save just in not fly-ing somebody out there," Maguire said of a remote office site. "You'll burn that up in just an hour of consulting time."

Mark Bos, a user support analyst at Baptist Health Care in Louisville, Ky., said he believes that the \$50-per-seat cost of LANDesk is high but worth the expense. Baptist uses homegrown applications to distribute software to 3,500 desktops.

"Whether it's a homegrown tool or go boxes for a client, it's obviously the smarter way to go," Bos said. □

DOE revamps database

CONTINUED FROM PAGE 59

workforce from 12,000 to 8,000, he said.

"Going down to one contractor meant that Lockheed Martin saw the entire issue. When they pulled information together from different databases, they couldn't correlate it," Applione said.

The DOE sought to organize its database streams using analysis tools from Gentia Software, Inc. in London. "With the number of organizations we have to

watch over and the number of people reporting information in to us and the amount of information we had going out, we were facing quite a mess," said David Brown, a staff engineer at Lockheed Martin Idaho Technology Co. The company, in Idaho Falls, Idaho, is the DOE's prime contractor.

The agency adopted Gentia's application development environment, which pulls information from databases that run on IBM mainframes, Unix servers and Sun Solars. It then loads the information on one server — in this case, a Hewlett-Packard Co. server.

The various categories of information — from financials to accident reports to human resources — also are calculated

in Gentia's multidimensional database. The system gives the agency one key application to consult for answers, Applione said. The DOE plans to tie more users in to the system later this year — more than double the 120 staffers who now have access.

Brian Murphy, an analyst at Yankee Research Group in Boston, said Gentia is a little ahead of its competitors such as Arbor Software Corp. in Sunnyvale,

Calif., in terms of taking multiple databases and pulling information into "cubes" of similar information that can be stored on a separate server.

But Murphy added that Gentia doesn't make for real-time solutions because any queries are being done against a secondary database, not the up-to-the-minute main database. "And it's not as simple as loading a database," Murphy said. "It might take 24 hours to load up, and that's a problem if you want the latest and greatest information."

Brown said that hasn't been a problem for the DOE. The agency is using Gentia to uncover longer-term data trends, he said. □

The DOE's Scott Applione
Inaccurate and inconsistent queries plagued the agency for years

Microsoft, Sybase

CONTINUED FROM PAGE 59

tions such as SAP AG's R/3).

Sybase plans to ship its Adaptive Server Enterprise 11.9 database this quarter, although the company initially will go only to application vendors for certification purposes. Meanwhile, Microsoft sent out a second test version of its SQL Server 7.0 this month and is promising commercial shipments later this year.

Row-level locking closes off smaller blocks of data when users update records than the page-level locking schemes Sybase and Microsoft use now. That should mean quicker performance, especially on packaged applications written with row-level locking in mind.

Blue Cross/Blue Shield of Alabama is one Sybase customer that is feeling some pain because of the current lack of row-level locking support.

The Birmingham-based insurer runs PeopleSoft, Inc.'s human resources applications on Sybase. But Darrell Bilbey, the company's information systems manager for human resources, said he can't run multiple payroll jobs at the same time because database throughput gets bogged down.

That sometimes forces Blue Cross/Blue Shield to do payroll processing during business hours, and that can lock

data away from users who need to access records or run queries. Bilbey said. "Row-level locking should ease that up for us a bit," he said, adding that he is hoping for a tenfold performance boost based on general benchmarking by Sybase and PeopleSoft.

The one drawback is that row-level locking may require Blue Cross/Blue Shield to upgrade its Unix server with faster processors and more memory. But Bilbey said the speed-up should be worth the added hardware cost.

Anthony Bradley, an analyst at Meta Group, Inc. in Stamford, Conn., said row-level locking has become a necessity for Microsoft and Sybase because of the growing strategic importance of packaged applications to database buyers (CW, Jan. 5).

"They've been waiting until the last possible minute, and it's basically arrived," Bradley said. For example, he added, Sybase has to get by now with only "insignificant" sales involving packaged software (see chart, page 59).

Microsoft user James Xu, vice president of technology at Anatrade Publishing, Inc. in Washington, said he has seen "almost unimaginable" speed gains while beta-testing SQL Server 7.0 on his 75C-byte voter information database.

"They've rewritten the whole engine from the ground up, and row-level locking is a big thing for boosting performance," Xu said. □

can optimize performance and even reduce Windows 95's delinquent behavior.

A related module, System Doctor, is the software equivalent of a cardiac monitor. It tracks a system's critical processes, sounds an alarm and suggests fixes when it detects such events as low memory, low disk space or outdated virus definitions. Symantec also bundles into Version 3.0 a feature-limited version of its antivirus program.

Other new features include a centralized interface, a registry compaction facility and a file sweeper that purges hard drives of unwanted or old files.

New features can help you recover from system crashes or freeze-ups, including the option to boot directly to Windows rather than DOS when recovering a system. A new module, Crash-

PRODUCT REVIEW

► Norton Utilities for Windows 95 3.0

Symantec Corp.
Cupertino, Calif.
www.symantec.com

Price: \$79-95

Pros: New interface simplifies using the program's many tools

Cons: Doesn't include some features from earlier versions

programs by preloading segments of applications.

Symantec unfortunately excluded helpful features that it had offered in its earlier products. Notably absent from

Version 3.0 is the ability to zip/unzip files, open electronic-mail messages encoded in Multipurpose Internet Mail Extension, BinHex and UUEncode and the secure erase feature that overwrites deleted files.

Even in light of such omissions, Version 3.0's many new features and improvements can help you achieve a reasonably trouble-free PC — assuming such an entity can

exist. □

Millman operates Data System Service Group LLC, a consultancy in Croton, N.Y. He can be reached at (914) 271-6883 or hmillman@lbn.net.

NEW PRODUCT

QUARTERDECK CORP. has announced Realhelp Extra Strength, a utility for Windows 95 that detects problems that lead to system crashes and application freezes.

According to the Marina Del Rey, Calif., company, the software monitors for 16- and 32-bit exception errors and stabilizes applications that are about to crash so users can save and exit work. It can detect hardware and software problems and offer solutions.

The utility costs \$59-95.

Licensing changes cut costs of document management

By Barb Cole-Gomolski

SOME MAKERS of document management software are dropping their hefty per-seat price tags and moving to a more affordable licensing model.

The new pricing schemes — which resemble Microsoft Corp.'s — could make it more feasible to deploy document management across the enterprise.

The price reductions that have come from companies such as FileNet Corp., in Costa Mesa, Calif., and Eastman Software, Inc. in Billerica, Mass., are overdue, users said.

"It's hard to justify the expense of a document management system for an application that is used by a handful or a few dozen people," said Jim Aszewski, systems developer at Dreyer's Grand Ice Cream, Inc. in Uxton City, Calif. The ice cream maker uses a document management system from London-based Intrinet Solutions, Inc. to track its recipes.

A few years ago, it was common to pay \$1,000 or more per seat for client software that could handle document management and image processing, recalled Loretta Gorakzyk, imaging manager at American Presidents Line Shipping Ltd. in Oakland, Calif. "We told the vendors they needed to make it much more affordable," she said.

Users may be charged several thousand dollars for a server with unlimited client access. Where per-seat pricing is available, the cost has come down to be-

CUTTING PRICES

November

- **Eastman Software moves from a per-seat model to a server and client access model**

January

- **FileNet rolls out new software bundle, which gives users basic document imaging and workflow features for less than \$500 per user**
- **Felt Systems cuts prices on some of its document management systems by 45%**

tween \$100 and \$500 per client.

Connie Moore, an analyst at Giga Information Group in Cambridge, Mass., attributed the price shift to the growing popularity of low-cost document management systems designed to work with existing electronic-mail systems. Eastman Software and FileNet sell such products for Microsoft Exchange.

"These products may have 80% of the functionality [of traditional document management systems], but they are a lot cheaper," Moore said. "That puts a lot of pressure on the high-end document management vendors" to lower their prices. □

Norton's new integrator separates the tools into four primary functions

Guard, tries to intercept Windows' Invalid Page Faults, Access Violations and General Protection Fault messages and offers you the opportunity to close the offending application, save your work or try to repair the fault. The new Anti-Freeze adds a button to the Ctrl-Alt-Del box to unlock applications.

My IBM PC-750 made a perfect test bed for evaluating crash guard modules. Having had dozens of review applications temporarily installed on it, Windows 95 crashed three or more times per day for no apparent reason. Norton's recovery duo let me gracefully extricate myself from three out of four of those irritating and time-wasting ordeals. That ratio approximately correlates to the recovery performance of Bomb Shelter, a module included in Helix Software's Nuts and Bolts utility collection.

Other improvements in Version 3.0 include an updated SpeedDisk defragmenter/optimizer. The first time I ran it, I directed it to reposition files by moving the files accessed most frequently to the outer disk tracks. After the reorganization, Windows 95 loaded several seconds faster. Another new module, SpeedStart, boosted the loading speed of often used

Web tools open path to vital data

By Jai Kumar Vijayan

MOST BUSINESS-CRITICAL enterprise data is usually hosted on mainframes or proprietary mid-range computing environments.

It is the kind of data a company relies on to run its business. But it has also been the kind of information that is usually directly accessible to very few users and available on PCs and desktops only via relatively clunky host connectivity products.

Internet technologies are be-

ginning to change a lot of that. Host-to-desktop connectivity vendors are using Internet, intranet, Java and World Wide Web browser technology to give users a range of products for easily accessing applications and data from multiple hosts. And new tools are giving users ways to spruce up drab character-based terminal emulators and organize the information on them with graphical user interfaces.

"I don't think any vendor can afford to ignore Web and brows-

TAPPING ENTERPRISE DATA VIA THE WEB

Vendors are offering the following Web-to-host products:

- Web-enabled server products that let customers make legacy data and applications available via any browser-based client
- Web-enabled clients that provide direct browser-based access to host data
- Tools that let users customize screens and migrate applications to the Web
- Products for secure Web-to-host connectivity

er technologies" for host connectivity purposes, said Mike Gentile, vice president of Zurich American Insurance Group, in Schaumburg, Ill. Gentile said such products "have a lot of appeal for customers, especially

from an ease-of-use and deployment perspective."

At a basic level, the products link host systems to desktops via the Internet, intranets or extranets using Web browser tech-

Web tools, page 68

CLIENT/SERVER

Users await networked client backup

By Nancy Dillon

STORAGE MANAGEMENT software is one tool that information systems departments can use to reduce the administrative costs associated with client/server-based systems, according to users and analysts.

But although there are lots of products available for server backup and restore, there are few options for networked client backup.

"We have about a half of a terabyte of storage on our network, and 20% of this is on Windows clients," said Michael Wardcut, systems administrator in the data center of Interloc, Inc., a Greenfield, Mass., company that tracks out-of-print and antique books.

"I'd love to see a product for backing up clients across a network that's fast and isn't a bandwidth hog. We can't afford to give up full performance for very long," Wardcut said. Interloc uses ARCserve for NT from Computer Associates International, Inc. to back up 30 servers.

Philip Mendez, an analyst at Client backup, page 68

Intel's Tillamook chip may be moot

► Analysts: Most notebook users will wait for faster chip due this spring

By Kim Girard

WHILE SOME companies will take advantage of newly announced faster notebooks based on Intel Corp.'s Tillamook

processor, analysts said most will hold out for the higher-performing Deschutes processor, due this spring. "[The 266-MHz processor] is a 'twentee," said Gerry Purdy, president of Mobile Insights, a Mountain View, Calif.-based consultancy. Shipping after the touted 233-MHz Tillamook chip and before Deschutes, the mobile version of the Pentium II, the Tillamook will have little chance to build momentum, he said.

Deschutes processors, which will start at 266 MHz, are expected to enhance notebook performance by 25% to 30%, but they also will sap battery life by 10% to 15%, Purdy said. Jerry Winchell, controller for IT at Progressive Insurance Co., in Mayfield Village, Ohio, which

has about 3,000 Hewlett-Packard Co. and Dell Computer Corp. laptops, said his company has just started to map out a migration from 166-MHz notebooks to 233-MHz machines, so Deschutes isn't an immediate concern.

"The processor is a secondary thing," Winchell said. The size of a hard drive and the quality and size of the display are more important to their users, he said. Frances Nieves, a senior systems analyst at Sun Oil Co. in Philadelphia

who manages 300 Toshiba laptops, agreed. "The speed doesn't bother the user as much as disk space," he said, noting that most of the company's "power users" still use desktop machines. "We usually don't jump on the bandwagon. We wait until the notebooks come down in price."

Recent 266-MHz Toshiba notebook announcements include the following: ■ Compaq Computer Corp.'s refreshed product line, equivalent the Model 7000 desktop-equiva-

lent line, Model 4000s, which are aimed at businesses, and the lower-cost 1900 models. The high-end Armada 7790DMT boasts a 13.3-in. color thin film transistor screen, a 5G-byte hard drive that is expandable to 10G bytes and power management capabilities. Priced at \$5,699 for the Windows 95 model, the 7790DMT will be available next month. The company's 5.6-pound 7780DMT is available immediately.

■ The Inspiron 3000 from Round Rock, Texas-based Dell. Priced at \$5,199 and available now, it has 32M bytes of RAM, a 2.1G-byte hard drive, a variable 20-speed CD-ROM drive and a 13.3-in. active-matrix display.

You can talk about raising the bar a notch or two, then you can talk about Sun Microsystems® new Enterprise 450 workgroup server. Not only is the E450 competitively priced, it's faster, more stable and more flexible than any Microsoft Windows NT-based server.

Powered by up to four 250 or 300-MHz UltraSPARC-II™ processors, the Sun Enterprise™ 450 system outpaces the best Windows NT system by over 33%*. What's more, the E450 works seamlessly with all the workstations, PCs and Mac systems you have in place.

Working closely with leading software developers, Sun has created a group of solution "recipes" - all the ingredients needed to deliver business-critical solutions. Whether your recipe calls for Computer Associates®, Lotus®, Netscape® or Oracle®, it's going to cook like never before on the E450.

For more information on the Enterprise 450 or to locate a nearby E450 reseller, e-mail AccessGraphics, the world's largest distributor of Sun Microsystems solutions, at E450eu@access.com or visit our Web site at www.access.com/E450.

nology and Java. Those connections let companies make better use of their enterprise data, said Ted Schaffer, an analyst at Forrester Research, Inc., in Cambridge, Mass.

FAST INFORMATION

For example, by tying a legacy customer information database to the Web and making it accessible to a browser-enabled client, insurance or telecommunications companies can make more information available to service representatives faster than before, analysts said.

"There is a tremendous opportunity for companies to leverage their data across not only their existing user populations, but to ease access for remote users and make more information available to business partners, vendors and customers," said Lucinda Borovick, an analyst at International Data Corp., in Framingham, Mass.

The Mark Travel Corp., in

Milwaukee, for example, uses Web products from Pericom Software in Hamilton, N.J., and Citrix Systems, Inc. to improve mainframe-to-desktop connectivity.

The company, which provides vacation packaging services to airlines, is considering linking some of its smaller sites and overseas agents back to its mainframes via Internet connections.

"Each product improves our connectivity and increases our ability to make data available to all our users and agents around the world," said Jeff Kleyberg, LAN administrator at the company.

COLLEGE CONNECTION

The University of Wisconsin, in Milwaukee, is using a Web product from Unifix Technologies, in Phoenix, to deliver mainframe-based information on registration, financial aid, course selections and grades to

client desktops. Using it, students and faculty can access what they want via a graphical user interface.

Last week, connectivity products vendor Wall Data Corp., in Kirkland, Wash., announced six products as part of a new strategy aimed at providing users with Web-enabled legacy data access.

The company's new CyberServer Server Products, for example, sit between a customer's legacy host system and client desktop.

The products link host-based data with any browser-based client via the Internet, an intranet or extranet. Web tools included in the announcement let users customize screen presentations and migrate host applications to the Web.

Wall Data joins a horde of relatively small to midsize vendors that offer products with varying degrees of the same capability. Included in the list are companies such as Unifix; OpenConnect Systems, Inc., in Dallas; Pericom Software; Citrix Systems, Inc., in Ft. Lauderdale, Fla.; and Graph-On Corp., in New York. □

Users' tips for NT backup and restore

- Test your system restore procedure regularly
- Document what is being backed up and to which tape device
- Streamline file filters to help users identify location of their data for restores
- Build added hardware redundancy wherever possible

Client backup

CONTINUED FROM PAGE 65

International Data Corp., in Framingham, Mass., said War-chor's request will soon be answered by several vendor announcements.

"Client backup and restore will be a hot area for storage management software in 1998. And I imagine most of the initial announcements will be in the NT server space because of easier integration," he said.

NT BACKUP

In fact, the two market leaders in NT backup software, Seattle Valley, Calif.-based Segate Technology, Inc. and Islandia, N.Y.-based CA, have confirmed upcoming plans to release utilities for streamlined client backup up to NT servers.

Segate's utility, called Easy Storage Manager, is due next month as an option for Backup Exec (see related story at right). Its console will run on NT 4.0 or 5.0 servers, and it will be compatible with any Windows-based, 32-bit client system.

Administrators using Backup Exec will control what client information is backed up, when it is backed up and over which percentage of bandwidth. But users will be able to initiate data restores themselves using Windows Explorer.

A feature called "versioning" will allow multiple versions of a single document to accrue over time and be accessible to end users.

CA's client backup initiative, which will be delivered as enhancements to CA's storage management products in the second half of the year, is called Managed Client Backup. It will allow partial file backups at the data block level, include duplicate file detection and offer the ability to do periodic backups that will kick in whenever client workstations are left inactive.

Bruce McKellan, a network administrator at the Houston-based chemicals and pharmaceutical company Solvay Group, said administrator control over

bandwidth allocation would be critical because user freedom to do full client backups at any time could lead to network congestion.

McMillan said with newer applications that require Windows NT Workstation—such as his group's soon to be released application for tracking United Parcel Service shipping—he sees great benefit in enabling users to service their own backup requests.

"It means they won't have to call us, and my operations staff will be free to work on other projects," McMillan said.

He said he used Backup Exec to back up 17 NT servers containing 2007 bytes of electronic mail, database and file-and-print services data. □

Segate plans updated agents for Backup Exec

Segate Technology will claim have confirmed plans to release updated Exchange and SQL agents for the company's Backup Exec Windows NT software. The options are planned for release in the second quarter along with Backup Exec Version 7.1.

The new Segate Backup Exec Agent for Microsoft Exchange Server will enable backup and restore of user mailboxes. That will let administrators restore the most critical user mailboxes ahead of full Exchange restores in the event of a server failure.

The updated Segate Backup Exec Agent for Microsoft SQL Server will incorporate native SQL dump and load commands and allow individual table backup and restore ahead of full database backup and restores. — Nancy Dillon

Intel's Tillamook chip

CONTINUED FROM PAGE 65

The product has a 3.86-byte hard drive, a 30-speed CD-ROM and floppy disk drive and a bay that allows users to hot-swap a second 3G-byte hard drive or a second battery that gives it more than seven

hours of life.

The notebook will be available late this month, with pricing to be announced.

■ Palo Alto, Calif.-based HP's new Omnibook 1000. It weighs 6.7 pounds and has a

13.3-in. display, a 4G-byte hard drive and a 128-bit NeoMagic MagicGraph video controller and zoomed video capability. Pricing starts at \$3,999.

■ Somers, N.Y.-based IBM will add a 266-MHz processor to its 386XD ThinkPad in March.

The notebook, with a 5G-byte hard drive, a 12.1-in. display and 32M bytes of RAM, will cost \$4,200. □

NEW PRODUCTS

INTERGRAPH COMPUTER SYSTEMS has announced StudioX RenderRAX II, a rack-mount, multiprocessor Pentium II rendering system for Windows NT.

According to the Huntsville, Ala., firm, the system enables animation and video and lets film professionals combine multiple RenderRAX II units into an environment. Individual units can support up to 512M bytes of memory. Each is powered by dual 300-MHz Pentium II processors and has a 4G-byte hard drive and a 10/100Base-TX Ethernet controller. The system costs \$9,750.

Intergraph Computer Systems

www.intergraph.com

MICROBOARDS TECHNOLOGY, INC. has announced Desktop CD-R Publisher, a hardware and software system for CD publishing in small businesses.

According to the Chanhassen, Minn., company, the system includes one four-speed CD-Recorder, an autoloader, two CD holders, editing software, premastering software for Windows 95 and NT, duplication software, print controller cable and print alignment posters. User requirements are a host computer with Windows 95 or NT, 16M bytes of memory and a SCSI host adapter. The system costs \$5,690.

Microboards Technology
(612) 470-1848
www.microboards.com

RADIOLAN, INC. has announced the Wireless Backbone Link, a stand-alone bridge that enables in-building transmission among wireless products and 10Base-T Ethernet LANs.

According to the Sunnyvale, Calif., company, it has one wired IEEE 802.3-compliant Ethernet (10Base-T) interface and one Radiolan wireless interface.

Support for 10M bit/sec throughput and World Wide Web-based backbone management software that can be accessed via the Internet are also included.

The Wireless Backbone Link costs \$999.
Radiolan

When you're shelling out \$4,000,000
to ring in the Year 2000, remember:

SAS[®] software didn't drop the ball.

While other software companies scramble to help you adapt your programs to handle the Year 2000 crisis, SAS Institute has just one question: *What crisis?* SAS software solutions—from data warehousing to data mining, OLAP to applied analysis—are ready to handle dates through the year 20,000 AD. And you can easily change the interpretation of two-digit years to the 100-year span of your choice.

SAS software customers won't need to shell out the estimated \$3-\$4 million it will cost the average company to address the Year 2000 issue. So isn't it time you invested in the world's best decision support solutions? From a vendor that will keep you on the leading edge of technology into the new millennium—and beyond? Just visit us at www.sas.com/y2k/ or call 919-677-8200.

SAS[®] SAS Institute Inc.
The Business of Better Decision Making

It's impossible to succeed at data warehousing without the right database.

NCR Teradata® database.

Because it's a different game.

To succeed in data warehousing, you need a database that's built for the job. A database that delivers maximum scalability and manageability. Plus world class performance.

Only one is designed for exactly that—NCR Teradata.

Start with a small datamart, and scale to the biggest of data warehouses. The sky's the limit. And only NCR Teradata scales in multiple dimensions.

So lots of users can ask lots of complex business questions of any data, at any time. All while significantly lightening your administrative workload.

No wonder the four biggest retailers, the top three airlines, and two of the top three banks in the U.S. already use NCR Teradata.

And speed? In industry benchmarks, Teradata

soars past the performance of every other database.

Let us show you how the only database truly built for decision support can turn your data into a real competitive edge. To help

you get off the ground, we'll give you a trade-in credit on your old database.

Call 1-800 CALL-NCR. Or visit us on the web at www.ncr.com/teradata.

All every kind of data warehousing, NCR Teradata outperforms other databases.*

Hybrid databases enter warehouse

► Move reinforces scalability, adds flexibility

By Linda Wilson

HYBRID OBJECT and relational databases are finding their way into the warehousing world. Companies are beginning to use data objects to embed sophisticated data cleansing, modeling, calculating and forecasting routines in a relational data warehouse.

Hybrid databases were developed as a way to add unstructured data, such as text or video, into a database. Informix Software, Inc. markets object exten-

sions to its database called DataBlades. Oracle Corp.'s object extensions are called Cartridges, and IBM's DB/2 Universal Database supports multimedia extensions.

Because relational structures handle only simple calculations, such as addition or subtraction, users typically move data from the warehouse to a separate server or desktop application to perform complex functions. But doing sophisticated analysis within the framework of a relational database has performance

Sabre Technology's Brad Jensen is building a warehouse for American Airlines using customized DataBlades.

and other advantages, even if it isn't right for everyone and tends to be proprietary, consultants said.

Hybrid databases appeared to

Sabre Technology Solutions because they combine the scalability of relational databases with the flexibility of object code.

Putting queries where they belong

► Sun Chemical takes query writing out of programmers' hands

By Sharon Gaudin

SUN CHEMICAL CORP. is freeing up to its programmers to build applications instead of writing queries by putting a technical-friendly tool into the hands of its nontechnical data warehousing manager.

Sun Chemical, a \$3 billion printing ink company that emphasizes its products on more than half of the packages in your local grocery store, has stitched together a string of six individual data marts to create its data warehouse. That has been working well enough for the company.

However, for the three and a half years since Sun Chemical started the data marts, a group of 10 Cobol programmers has

been focusing its efforts on writing queries instead of building business applications.

"If it took one of our programmers three days to write a Cobol program to do some-

thing, I can do it myself in a day or less now," said data warehousing manager Dave Fritz. He now uses the data mart building component of Sagent Technology, Inc.'s data mart product. "Sometimes it might even be 10 days to one day, depending on the complexity of

Sun Chemical, page 72

COMMENTARY

Problem-solving

SHAKU ATRÉ

DO I NEED to improve business operations or analyze and project trends?

That is one of the questions you must answer before you build your data warehouse. You can't decide after you've built it, because each warehouse requires different tools and approaches. And besides, to convince management of the warehouse's utility, you first need to know what business problem you're trying to solve.

Operational data warehouse applications provide decision-makers with information that

helps them monitor and control the company. For example, a utility company could use accounting information in a data mart to plot spending over the course of the year to find opportunities for cost reductions. It also could study the annual

load and reschedule staff to avoid overtime. Such applications use tools such as agent technology query and reporting tools and online analytical processing and multidimensional databases.

Analytical or data mining applications, meanwhile, use so-

Hybrid database systems

CONTINUED FROM PAGE 71

enlarged Brad Jensen, a vice president at The Sabre Group division that develops information systems for the travel industry.

Sabre built a 400-Gbyte summary database warehouse for American Airlines in 1993 for several types of analysis, such as passenger demand, fares and routes. However, American Airlines later decided it wanted a larger warehouse with detailed data to improve the results of analysis, Jensen said. Sabre is now working on that project.

The first phase of the new 3T+ to 5T+ warehouse is scheduled to debut in June. It will use Informix's Dynamic Server with DataBlades (formerly Universal Server) running in a parallel environment. An important part of the strategy is the ability to reuse object code, Jensen said. Sabre is building customized DataBlades using

the tool kit from Informix, which contains objects for security and integrity, for example.

The strategy also will ensure that everyone at American Airlines uses the same calculations. "American Airlines wants to standardize calculation methods and variable names," Jensen said. For example, departments have different ways of defining such common variables as market and fleet. Departments also may calculate formulas, such as the percentage of local passengers on a flight, differently.

Jensen declined to reveal information or return on investment figures.

READY-MADE

For IT departments that don't want to custom-build object extensions from tool kits, vendors are marketing prebuilt products. Informix, for example, has 35

DataBlades for a variety of users; another 35 are scheduled to be released during the first half of this year. Prefab DataBlades that handle time series analysis, statistical analysis, geographic mapping and data cleansing are available from Informix and a variety of third parties for \$400 to \$1,500 per concurrent user.

Another approach is touted by Broadbase Information Systems, Inc. in Menlo Park, Calif. Broadbase markets a server-based data mart product that combines a proprietary relational database with multidimensional capabilities and Java class libraries, allowing for data analysis ranging from simple arithmetic to complicated algorithms. The Java code also allows data transformations to occur within the database.

DSC Logistics in Des Moines, Ill., installed Broadbase in October. The midsize company

chose the product because it offers a lot of functionality, such as for data transformations and data mining, said Tom Gilda, interim chief information officer and a member of DSC's board of directors. At the same time, Broadbase is easier to install and maintain than a typical data warehouse at a Fortune 500 company, Gilda said.

It took four hours to install Broadbase and a couple of days to design the data model and identify the data elements. One person manages the system, Gilda said.

Despite the advantages, hybrid databases haven't caught

on in the warehousing world. Robert Craig, director of data warehousing and business intelligence services at Hurwitz Group, Inc. in Framingham, Mass., said that is because vendors haven't marketed the benefits aggressively enough and their systems tend to be proprietary.

Nonetheless, Jensen is convinced that others will deploy hybrid databases. "We have seen a lot of [object] extensions to add strategic business functionality," he said. □

Atre: problem-solving

CONTINUED FROM PAGE 71

phisticated software to help staff members come up with insights about a company's customers, processes and markets. For example, a company might study its customer base and identify new niche audiences for its products. That could enable the company to tailor marketing more closely to customer needs. Tools used here include statistical analysis tools, discovery-based data mining tools and visualization tools.

Those categories are distinct, but companies often confuse them. When companies build a poorly defined data mart or data warehouse that delivers technical capabilities that aren't tied to solving a particular business problem, the results of the system usually isn't very good at either analysis or operational monitoring.

For example, a multidimensional database (MDD) lets you study the interdependence of many factors (dimensions) that impact how the business is running (by store, by salesperson, by product line, etc.). That can help you monitor the business. You first define these dimensions and then summarize the data to fit them.

What if you want insights into what customers buy? That will be difficult to do with an MDD because the data is already summarized in specific ways that define the problem. You could reengineer the dimensions.

But summarized data will never really support wide-ranging analysis. You need to analyze the underlying detailed data. A data mining tool lets you study the detailed data

from many angles.

Dividing applications into these two categories and seeing which type appeals to senior executives might also help you determine which is more likely to win approval. Some executives will be more excited by an application that promises direct improvements to operations through strengthened control in spending, personnel deployment, inventory control or manufacturing process efficiency. Others will prefer the "deep stick" that analyzes the data and looks for breakthrough understanding and predictions about customer behavior.

Both categories have the potential for huge returns. But IT executives would be wise to try to create or buy applications that "look operational" and have the ability to solve business problems.

AVOID VAGUENESS

All too often, companies simply put the technical capabilities in place and expect that their purpose will emerge after they're put to work. Some say vagueness is necessary because business users don't know in advance what kinds of questions they'll need to ask.

But much of that vagueness could be avoided with better planning and IT's insistence (backed up by senior management) that nothing can be built unless and until it addresses specific business issues. □

Atre is president of Atre, Inc., a consulting firm in Port Chester, N.Y., that specializes in data warehousing and database technology. She can be reached at shak@atre.com.

Sun Chemical

CONTINUED FROM PAGE 71

what we need done. They were spending a lot of their time writing a program to extract the data or cleanse the data. And now I do it all myself," he said.

A data warehouse is a large set of historical information that covers several areas such as human resources, financial information and operational numbers.

A data mart is the little brother of the warehouse. It generally holds a much smaller amount of information that is focused on one area. A retail company, for example, might have a data mart that only has information on sweeter sales or sales in the Southwest.

Sun Chemical, in Fort Lee, N.J., has separate data marts for human resources and operational information. But the majority of data marts are focused on financial information, letting the company know what its customers are buying, how much they are buying, when they are buying and what it cost Sun Chemical to produce its mks. Sun Chemical's half-dozen marts run from 2G to 3.5G bytes.

Fritz turned to Sagent, in Palo Alto, Calif., to put more power into his hands and more time into his programmers'

hands. He said for a tool to be useful, it has to be powerful and extremely easy to use. "I'm not technical," said Fritz, who previously was the business systems analyst. "Three and a half years ago, my boss said, 'I want you to be the new manager of data warehousing.' And I said, 'What's a data warehouse?'"

Sagent eased Fritz's headaches by offering iconic and point-and-click programming. It also offers a data flow plan, which helps Fritz design how information will move into and out of the data marts.

Fritz runs Sagent on a Windows NT server, which runs most of the company's systems, along with one Digital Equipment Corp. Alpha server.

Karen Boucher, vice president of The Stansbury Group International, Inc., said any time a tool can put querying power in users' hands, it is an important step in the long process of culling useful information from streams of numbers.

"The easier it is for users to have access to and manage the information they get, the more the system will be used and the more strategic the information in the warehouse becomes," she said. "And the users who may not be the technical guys handling the warehouse are much

more familiar with what they need to get out than the techie guys. If they're doing their own queries, they're doing better queries."

Carlos Cabrera, vice president of information systems at Sun Chemical, said giving Fritz the ability to get his own information out of the system was the only way to make the data marts financially viable.

"We just don't have the resources or the staff to do the otherwise," Cabrera said. "Even the tool we're using now with Sagent still needs more functionality to make that process more repetitive and more reliable. We need a good scheduling function that Sagent said is coming, and that will allow us to control the process without having technical people looking at it much at all."

And making the data marts produce reliable and consistent information without a lot of tinkering means a big cost savings for Sun Chemical.

BETTER DECISIONS

Fritz, who didn't provide cost or saving figures, said being able to clearly see and understand the information being stored helps his company make better business decisions. "We need to see what areas we're falling down in," he said.

Cabrera said, "It's the consistent access to data that allows us to make small but better decisions on a day-to-day basis." □

CALL FOR ENTRIES

Bill would like to have a word with you...now.

HURRY!
Deadline for
entries is
January 23!

"Congratulations."

If you think your custom application development deserves recognition, now's the time to prove it. Enter your innovative Microsoft® Windows® solution in the seventh annual Windows World Open today. It's the international competition that recognizes the best in Windows development — with each winner personally presented an award from Bill Gates. And isn't getting the good word from Bill a great way to get the recognition you deserve?

Submit your entry by January 23, 1998.

Contingency planning When DISASTER strikes

Even if you're 110% sure your systems will be ready for the date change, experts say it's a good idea to have backup plans

By Gary H. Anthes

When an information systems group at the state of Washington performed a routine test of its disaster recovery plan two years ago, it decided to take a peek at its own year 2000 problem. But setting the mainframe's system date forward to 2000 caused the entire exercise to come to a screeching halt. Testers' passwords had expired, the computer said.

That unexpected setback convinced the IS group not only that it needed year 2000 contingency plans, but also that those plans had to be tested.

Surprisingly, contingency planning is an idea many organizations have yet to embrace.

But experts say all companies should have contingency plans, even if their remediation programs are going well. No matter how much care is taken, some systems will break unexpectedly, and you can't assume suppliers and partners won't have year 2000 problems that will impact your business, they say.

Washington's Department of Social and Health Services has begun to put in comprehensive backups for the year 2000. For example, the Social Service Payment System — a huge, 12-year-old,

mission-critical system with poor documentation — is now far along in remediation. But just in case, the state is now field-testing a commercial, off-the-shelf accounts payable package that can be turned on quickly if needed.

The payables package lacks the custom system's bells and whistles, but it could churn out the department's \$50 million in monthly checks, says Kathy Rosmond, manager of the agency's Year 2000 Program Office.

The department also is developing a new case management system to replace several smaller legacy applications before Jan. 1, 2000. But if the

new system isn't making satisfactory progress by a specified "trigger date," the IS group will resume year 2000 remediation work on the old systems, Rosmond says. In fact, one of the old systems has already been converted, even though it isn't expected to be used.

Meanwhile, other large organizations haven't even given much thought to year 2000 contingency planning. Some say they'll get to it later, and some say they don't intend to make such plans at all.

Del Clark, year 2000 director at Phillips Petroleum Co. in Bartlesville, Okla., says the oil giant has 25 people working full-time and 150 part-time on its year 2000 project. He says he expects to have most of the conversion work done by year's end, and he doesn't intend to prepare formal, comprehensive contingency plans.

That's because the bulk of Phillips' date-challenged code will be swept away before 2000 by new, year 2000-compliant software from SAP America, Inc. and Oracle Corp., Clark says. "We have not done contingency planning because we assume they are going to make it. There is some slack in their schedule, so I think it's very realistic to think there's not going to be a problem."

As for software not covered by the SAP/Oracle work and other items that might fail, Clark says

YEAR 2000 SCOREBOARD

An occasional series on year 2000 trends, issues and statistics

Was 1997 the breakthrough year?

If 1998 is going to be the year that corporate America finally rolls up its sleeves and fixes many of its year 2000 problems, then last year could very well have been the year in which chief

executives woke up to the potential seriousness of the millennium bug. "The responsibility for grappling with year 2000 clearly has shifted from IT managers to the CEO," said Joel Goldhammer, a vice president at management consultancy A. T. Kearney's Strategic Information Technology Practice. Goldhammer made the comment in August after A. T. Kearney released a survey of Fortune 1,000 companies. According to the poll, 80% of the CEOs and non-information technology executives surveyed saw the year 2000 date-change problem as a

business concern, while 65% agreed that it's a serious management issue.

A series of tracking polls taken last year by Cap Gemini America, a New York-based year 2000 services provider, showed that corporate awareness about the date-change problem grew last year.

Cap Gemini released the following two issues in April, August and December in a tracking poll of 501 information technology directors and managers. The survey was conducted by Rubin Systems, Inc. in Pound Ridge, N.Y.

specific contingency plans for individual areas will be developed when and if it becomes clear they are at risk.

Companies that need contingency plans most are least likely to have them, says Capers Jones, chairman of Software Productivity Research, a software developer and consultancy in Burlington, Mass. "Less than 10% of our clients have a contingency plan for dealing with the things that aren't going to be fixed on time, and they happen to be the companies that are fixing most of the things anyway," he says.

Many companies take too narrow a view of the year 2000 problem, concentrating only on application software, Jones says. "But how do you get into the building if the badge lock doesn't work, or place calls if your phone system is out? And what will you do if there is no electricity for five days in a row?" he asks.

One good approach is to build year 2000 contingency plans on top of existing disaster recovery plans, which normally include at least some of the failures Jones cites. And, like all disaster recovery plans, the year 2000 plans should be tested under as realistic conditions as possible, experts say.

Tim Morton, a vice president at Electronic Data Systems Corp., says there are barriers against contingency planning. "It is, in many cases, a politically incorrect term because it implies incompetence. The plans are not well received in many circles because you're suggesting doubt."

But for companies such as The Prudential Insurance Company of America, in Newark, N.J., contingency planning is a necessary and prudent part of operations. Prudential's year 2000 contingency plans cover three broad areas — application software, internal infrastructure and external partners — and there are multiple failure scenarios and responses for each element.

For example, each major application has a plan for what to do if it's not fixed in time, if it fails on Jan. 1, if it fails after Jan. 1, if it calculates incorrectly but isn't discovered until later, and so forth.

The plans will be formally documented, widely distributed and tested, says Irene Dec, vice president of corporate information technology and year 2000 program manager. "The last thing we want to see on Jan. 1 is a lot of beepers going off and no one knowing what to do," she says. "Everyone will be carrying their little contingency plan in their pocket."

Dec says Prudential simplified and standardized its planning by centrally preparing "contingency templates" — checklists for business units to use in building their own plans.

Prudential sent its suppliers letters inquiring about their year 2000 programs. A corporate risk team will review the responses to determine what kinds of contingency plans are needed, Dec says. The risk team, which Dec heads, includes representatives from the IS, audit, control and legal departments, the company's seven lines of business and the corporate business continuation organization.

Such interdisciplinary risk teams are important for contingency planning, experts say. Morton says senior executives often believe the date-change problem is purely technical, so they hand the whole thing to IS. But IS may not be able to accurately determine the financial and legal impacts of an application's unavailability, he says. BankBoston has a year 2000 team in IS sponsored

by the chief technology officer and a corporate year 2000 team — which worries about resources such as power and telephone — sponsored by the bank's head of risk management. IS will prepare its year 2000 contingency plans this year, says David Iacino, a senior manager in IS.

Iacino says the bank also will do joint contingency planning with key partners such as the Federal Reserve System.

But Iacino says it's possible to go too far with contingency planning. "We could have a totally internal plan. We could have one with supplier A and another one with supplier B and with customers and so on," he says. "You could get consumed by it."

Geico Corp., in Bethesda, Md., tests its disaster plan, page 83

While the figures show obvious improvement, they disappointed Jim Woodward, senior vice president of Capers Jones & Associates.

Woodward's TransMillennium Services, But despite the apparently slow growth in awareness, there is no shortage of year 2000 optimism among those who took part in the survey. About 87% of the companies surveyed expect more than half of their systems to be compliant by Jan. 1, 1999.

"Corporate America is disturbingly behind schedule in dealing with the year 2000," Woodward said last month.

After nearly three years of tracking corporate responses to the year 2000 problem, we would have expected to see significantly more firms with detailed plans

in place by now."

"The year 2000, I guess, will go around every boardroom in corporate America for the next two years."

—Jon Stalenhorst, chief transformation officer, Chiquita Brands International, Cincinnati (November 1997)

The costs of being compliant

The following are some estimates of what it will cost companies and orga-

nizations to prepare for 2000:

- Centex Group, Inc.: \$600 billion; closer to \$1 trillion with litigation costs included
- Capers Jones, Software Productivity Research Group: More than \$9.6 trillion
- U.S. government: Its fixed assets will cost at least \$9.9 billion
- Canadian gov-

Source: Woodward, page 85

specific contingency plans for individual areas will be developed when and if it becomes clear they are at risk.

Companies that need contingency plans must be least likely to have them, says Capers Jones, chairman of Software Productivity Research, a software developer and consultancy in Burlington, Mass. "Less than 10% of our clients have a contingency plan for dealing with the things that aren't going to be fixed on time, and they happen to be the companies that are living most of the things amok," he says.

Many companies take too narrow a view of the year 2000 problem, concentrating only on application software, Jones says. "But how do you get into the building if the badge lock doesn't work, or place calls if your phone system is out? And what will you do if there is no electricity for five days in a row?" he asks.

SPECIAL REPORT YEAR 2000

DISASTER

CONTINUED FROM PAGE B1

recovery plans annually and will add year 2000 tests this year and next. The plans will include backups for services such as telephone, water and power, says Ron White, year 2000 coordinator at the company.

But White concedes there isn't much backup possible for telephone service and that a prolonged outage would be a "showstopper" for the company, which transacts most of its business over the phone.

Getco's plans will include manual backups for some important automated processes, White says.

For example, managers might retain paper copies of data on all policyholders as of Dec. 31, 1999, in order to cross-

check data from the online system if a customer disputes it.

Getco also could alter some business practices early in January 2000 as a contingency measure.

"We could take information from customers manually — so it is recorded in multiple places — if there are problems

with automated systems," he says.

Getco has pushed its year 2000 planning to a level of fine detail. For example, it will lay in an extra supply of paper for printing policies and checks in case suppliers' year 2000 challenges keep them from making deliveries.

Like many companies, Getco will have

its IS staff in a state of high alert in January 2000. In fact, it plans to have its New Year's party Jan. 1, on-site.

"If something breaks, we'll be here to fix it," White says. □

Archer is Computerworld's senior editor, special reports.

Legal considerations in year 2000 contingency planning

Although most contingency planning for the year 2000 focuses on technical and business issues, experts say there are some legal considerations that a company overlooks at its peril.

Robert Kanney directs a six-lawyer team of year 2000 specialists at Hogan & Hartson LLP in Washington, and he advises clients to prepare for damage claims from customers, partners and shareholders. Negotiate some risk sharing in contracts, if possible, he says.

Shareholder lawsuits will be encouraged if management doesn't adequately disclose year 2000 problems or if it fails to disclose due diligence in solving them, Kanney says. He says it's important for a company to carefully document its year 2000 remediation efforts, especially its reasons for taking any shortcuts that might later be construed as negligence.

Kanney also advises companies to review and possibly strengthen insurance policies for things such as business interruptions, errors and omissions, product liability and cybercrimes.

Warren S. Reid, a technology and legal expert and president of WSR Consulting Group, in Encino, Calif., offers this additional advice:

• **Contracts with contingency suppliers require special care.** They are complex because they're conditional.

• **Scrutinize contracts with your primary suppliers.** "If they are struggling, can you discontinue and go somewhere else?"

• **Examine contracts with customers.** "What if you can't deliver? Can they sue you for consequential damages? What you find a replacement?"

• **Be aware that contingency outsourcing contracts are costly and complex** because they're likely to be for short periods. — Gary H. Anthes

WE'RE BEST SUITED TO TAKE YOU
BEYOND THE TRANSITION.

Happy New Year from IBM.

It's the new year. Traditionally, this is a time when all of us take a moment to write down our list of resolutions. Resolutions that are, typically, all but forgotten by the end of January (early February at the latest).

Well, we'd like to stand up and say, right here, right now, that this will not be the case with IBM. Because our list of resolutions not only marks a change in the way we do things from last year to this year, but establishes an entirely new way IBM will sell personal computing solutions. Forever.

Resolution N°1: Machines when you want them. We will continue

to retool the way we manufacture and distribute our personal computing solutions.

THINKPAD 770

Extreme performance.
PC Magazine named it Best PC
of '98 at Fall COMDEX.
Optional internal DVD or CD-ROM.

THINKPAD 360

Ultimate portability without compromise.
Light and slim. Powerful with
Intel Pentium® processor with MMX™
technology up to 333 MHz.

THINKPAD 380

Powerful performance
and incredible
value, starting at
under \$2000 DDP.

NETFINITY 7000 SERVER

Industry standard server with you handle
the most demanding applications up to
4-way 200 MHz® Pentium Pro processors
with 1MB/512KB L2 cache.

PC SERVER 325

Scalable power ideal for medium-sized
businesses or corporate departments.
Up to two 266 MHz Pentium II or
200 MHz Pentium Pro processors.

Estimated resale price (ERP) for model 380. Actual resale prices may vary. Model 380 includes 150 MHz Pentium processor, 6011 screen, 1.5GB HD. Other features available for an additional charge. Other models up to \$2000 DDP. IBM reserves the right to alter product information without prior notice. ©1998 IBM Corp. All rights reserved. IBM, the IBM logo and Pentium are registered trademarks and MMX is a trademark of Intel Corp. Microsoft, Windows and Windows NT are registered trademarks of Microsoft Corp. All other names are trademarks of their respective owners.

This will add flexibility and get orders to our customers faster.

Resolution N°2: Machines the way you want them. Thanks to Resolution N°1, customers can custom-configure personal computing systems from IBM Business Partners to meet their unique needs.

Resolution N°3: Competitive prices. Our new way of building and distributing systems costs us less. So they'll cost you less. Period.

Resolution N°4: Higher performance. We will build the most powerful IBM PCs ever, with technology partners like Intel and Microsoft.

See how we're sticking to these resolutions by contacting IBM at

1 800 IBM-7255, ext. 5053, or www.pc.ibm.com/us

IBM

Solutions for a small planet®

IBM PC 300 PL

Advanced manageability built in for easy installation, maintenance and control. Intel Pentium processor with MMX technology up to 233 MHz.

IBM PC 300 GL

Competitively priced. Preloaded with Windows® 95 or Windows NT®. Incredible IBM manageability comes standard.

IBM INTELLISTATION

Highly manageable Windows NT workstations for the most demanding applications. PC Week named it Best of COMDEX '97.

OPTIONS BY IBM

Enhanced performance available with a wide range of Options by IBM. They're complete, high quality and affordable.

SPECIAL REPORT YEAR 2000

ED YOURDON

RE
THE GREAT IT
MORATORIUM
OF 1998?

Enterprise-wide moratoriums on new IT development will be the big news this year. If your organization hasn't declared a moratorium yet, it probably should.

Why? Because of the increasing urgency of the year 2000 problem, which many organizations have avoided dealing with until it's almost too late. The governor of New York imposed a moratorium in September, and the governor of California did it in November. The secretary of the Air Force announced one last June, and by now it's spreading throughout the entire Defense Department and many other federal agencies, too. More importantly, it will hit the entire private sector of the economy as 1998 budgets are announced. There were a few isolated examples of moratoriums last year, mostly in proactive organizations that did the arithmetic and concluded that they didn't have enough resources to focus on anything but the year 2000 problem in the months remaining before the Big Day. But for most organizations, the wake-up call came during the budget-preparation period that traditionally occurs in the late fall and early winter. In late 1996, when the '97 budgets were being prepared, the year 2000 still seemed far, far away—and not much of a problem, either.

Organizations have ongoing maintenance work that's required to keep the enterprise running; you also might have some unavoidable development work because of government regulations or other non-negotiable demands on your company. But anything that could be considered optional or discretionary should be brought to a screeching halt until you've not only repaired your own internal systems, but also taken the necessary steps to deal with the business consequences of the year 2000.

This isn't going to be a popular message, and it will almost certainly meet with heavy resistance from end-user de-

partments that view themselves as semi-autonomous profit centers; in a decentralized organization, they may feel they have the authority to ignore the moratorium request from the year 2000 program office. But 2000 involves survival, and it will probably be up to the CEO and the board of directors to impose the necessary moratorium to ensure survival.

SO, WHAT'LL BE ON HOLD?

What projects will have to be put off? For many companies, a moratorium will mean deferring the rollout and deployment of Windows NT. It may mean postponing the implementation of Windows 95 (assuming that Microsoft gives both to release it in 1998) and perhaps Office 95, as well. It means that a lot of the sexy new Java/Internet/Web projects will have to be deferred until 1999 or beyond. It probably means deferring the customary upgrades to PC hardware and software—knowledge workers will have to forgo those new Pentium IIs.

Along with a moratorium on brand-new application development, this year will bring two other forms of moratorium: one on replacement of legacy systems with new technology versions of homegrown applications and another on replacing proprietary legacy systems with large, complex packages from vendors such as SAP, PeopleSoft and Baan. Both forms of replacement were viable business strategies from 1995 to 1997, when organizations were first awakening to the year 2000 problem, but the window of opportunity is now effectively closed. It takes a large organization at least two to three years to adopt, customize and install a large, vendor-supplied package; there isn't enough time left to ensure finishing that task.

Similarly, it may have made sense in 1995 or 1996 to launch an in-house project to replace an aging mainframe system with a new client/server or Web-based system. But given most organizations' dismal track record for finishing development projects on time, any manager who can spell the words "risk management" has to put a moratorium on that strategy, too. Savvy organizations launched dual year 2000 projects in 1997: year 2000 remediation of old systems took place concurrently with separate projects to build replacements. This year there may be a few cases where that still makes sense, but most organizations no longer have the human resources for such a redundant approach.

Bottom line: The IT moratorium is here, and it's real. The sad thing is that it's too late and too uncoordinated throughout the economy. It won't happen in Europe and Asia until next year. It won't eliminate the year 2000 problems associated with the supply chain, which, for most organizations, involve 1,000 to 5,000 separate companies. The moratorium will reduce the size and scope of the year 2000 problem in an organization, but when the Big Day arrives, the only surviving organizations will be those that have adopted a full-scale contingency plan. As Oscar Wilde wrote in *The Picture of Dorian Gray*, "The basis of optimism is sheer terror." □

It's tomorrow TODAY

Date simulation tools will begin to take on an important role in year 2000 projects

By Amy Malloy

It's 1998. If you don't start year 2000 testing this year, you'll be in for a rude awakening come Jan. 1, 2000. You see, the test phase will represent 40% to 60% of your year 2000 budget.

In the past, companies have scrimped on testing to get a programming project done close to deadline. That isn't an option with a year 2000 project. If you don't test thoroughly and get it done on time, your systems might fail, and you could end up out of business.

Year 2000 teams this year are likely to add date simulation tools to their testing collection. Such tools are a good bet for anyone with a mainframe year 2000 problem, according to analysts. The products convince the system that it's working in the future by exchanging system dates with test dates. For example, once your programmers have identified and fixed date calls in your applications, you can test those fixes by making today's system date

It's tomorrow — today, page 88

month told *The London Times* that a 10% compliance failure rate will result in 600 to 1,000 deaths.)

• Elevators will drop to the bottoms of buildings.

• Computerized sprinkler systems could ice your lawn in midwinter.

• And last but certainly not least: A worldwide recession. □

To the back burner?

The date-change problem could hold back the completion of other IT projects

What impact will year 2000 have on other initiatives?

in corporations. An overwhelming percentage of respondents to a recent survey conducted for VisiSoft, Inc. in Phoenix expected their year 2000 con-

What initiative will be affected?

versions to have a moderate to heavy impact on other IT initiatives, with maintenance and new development being affected the most.

The U.S. Army, in fact, has postponed enhancements on all its IT systems until they have been analyzed, fixed, tested and certified as being year 2000-compliant. "We must deal with [year 2000] now so that our soldiers can continue to place well-founded confidence in their weaponry and automation tools through the change in [the] millennium," Army officials said in a recent memo.

SPECIAL REPORT YEAR 2000

It's tomorrow -

TODAY

CONTINUED FROM PAGE 87

appears different to the application. You might plug in a key date such as Jan. 1, 2000, at the end of the first fiscal quarter in 1999, March 31. Analysts mention eight tools in this market (see vendor list, page 89). What follows is a look at how your peers are using them.

HOW YOU USE THEM

Chief systems programmer Fred Ohr is using HourGlass 2000, a date simulator from Mainware, Inc., primarily in CICS. He says HourGlass works well because each tester for Pinellas County in Clearwater, Fla., can turn the simulator on or off for his terminal or transactions.

Bell Atlantic Corp. in New York is having good luck using HourGlass 2000 to test a sequence of dates, such as Jan. 1, 2000 and Feb. 29, 2000, because 2000 is a leap year, says Phil Stanley, manager of the Baby Bell's year 2000 testing strategy.

Fina Oil and Chemical Co. in Dallas uses Simulate 2000 from Prince Software, Inc. for unit testing, running one component of a system for testing, says Jack Sanders, group leader. The company simulates five unit test dates to check changes made to programs. Sanders says the only thing that makes him uncomfortable with a date simulator is that the date comes from the date simulator package and not the mainframe. Therefore, Fina has a logical partition with which the company can set the machine clock ahead for additional testing.

Analysts stress that date simulation tools address only one aspect of testing. Companies need to do other types of testing as well (see story, page 89). Most date simulation vendors agree with that, says Carl Gehl, a principal at Edge Information Group, a consultancy in Cincinnati. He is skeptical of vendors that claim they can do everything and warns users to beware of them.

NOT ROCKET SCIENCE

Working with these tools isn't like programming in C or building a data warehouse. Users and analysts say

date simulation tools are relatively easy to use and install, so there isn't much of a learning curve.

Mass Mutual Life Insurance Co.'s year 2000 team found HourGlass 2000 to be fairly straightforward. The key is understanding that the tool provides help with a specific type of test, which works well, says Priscilla Mandrachia, director of intercession and compliance on Project 2000.

The same held true for Fina Oil and Chemical. Sanders' team didn't need any formal training; they just used the manual that came with the tool. "I think it took our tech service people maybe just a half a day to read the book and download the tapes," Sanders says.

WHOM TO GO WITH

Analysts declined to recommend a specific date simulation tool. The major players are continually adding functions and features to their products, which makes it hard to pinpoint a leader, says Rich Evans, an analyst at Meta Group, Inc. in Stamford, Conn.

Gehl agrees: "I don't think there is any ultimate tool because it depends very much on your environment."

But analysts say if you already have a relationship with a vendor that sells a date simulation tool, you should buy the

"Testing is probably as difficult as we thought it would be."

- Priscilla Mandrachia, Mass Mutual

tool from that vendor. "Stick with the

people that brought you to the dance," says Dick Heiman, a research manager at International Data Corp. (IDC) in Framingham, Mass. The reasons: You know you can trust that vendor, and it will cut down the acclimation time.

That is why Lon Rinehart went with Computware Corp.'s date simulator, XChange. He uses other testing tools from the vendor, such as File Aid/Data Ager to age data coming in and out of programs. Also, XChange works well with the core applications in-house, primarily DB2 and IMS, says the systems officer at Ohio National Financial Services in Cincinnati. "It pays to have a well-developed plan and to have whatever tools are available to help you out with it," Rinehart says.

A previous relationship with Prince Software was part of the reason Sanders chose Prince's Simulate 2000. It also helped that he received a free 30-day trial of the product. He was able to make sure the product worked in his environment before committing to it, he recommends that companies looking at date simulation tools test before they buy.

"We have a long-standing relationship with Computware," says William Brydges, vice president of information systems at Comsera, Inc. in Detroit. People at Computware know Comsera's systems, so XChange was a natural fit, he says.

ASK THE RIGHT QUESTIONS

People shouldn't spend a lot of time choosing a date simulation tool. "It is not a huge expense to get the date simulation part," says Liz Barnett, a vice president at Giga Information Group in Cambridge, Mass. "It does not merit a six-month evaluation of these tools."

But time is of the essence, so it's important to get the right tool the first time. You have to ask vendors the right questions. You need to make sure the tool supports the languages and subsystems you use, Gehl says. You also need to make sure the product doesn't invalidate your license by interfering with traps some software contain to keep you from using the product past your license expiration date, he says. You should ask vendors if they have worked out this problem, he adds. □

Malley is Computerworld's associate editor. Review Center

12 criteria a date simulation tool should meet BEFORE you buy it

1. Interprets requests to all four date references: SYCS (prior clock), SYCN (java call), PC (program call), CVT (communications vendor table)
2. Enables date selection from mid-20th to mid-21st century
3. Provides for "rolling clock" capability after a test date has been chosen as programs run at the time with a real system clock
4. Requires no changes to the system, job control language or application
5. Supports all time/date formats
6. Supports all programming languages, including Cobol, PL/I, assembly, Basic, dBase and dBase
7. Supports online processing, including CICS, IMS and CA-IDS at the terminal, transaction or program level
8. Supports single or multiple jobs, steps, procedure steps or program names
9. Supports applications such as DB2 from IBM, Natural from Software AG and Ideal from Computer Associates International, Inc.
10. Supports ISPF
11. Provides for simple implementation, such as job name and simulated date
12. Provides support for LE/370 (Language Environment/370)

SPECIAL REPORT YEAR 2000

Tools, etc.

Users and analysts stress that although date simulation tools are useful, they aren't a testing panacea.

Date simulation tools take care of an important chunk of year 2000 testing, but other testing tools, methodologies and environments are needed to conduct thorough year 2000 testing.

Testing is expensive and time-consuming, but it's also crucial, analysts say. They say they fear that companies will run out of time and not test thoroughly or that they will rely solely on a date simulator tool.

going to be the most labor-intensive, time-consuming part — about 60% — of the company's year 2000 project.

Besides ensuring year 2000 compliance, the money and energy spent on testing gives companies a more complete understanding of their IT infrastructure and better testing methods, analysts say.

If companies establish a comprehensive testing process, they will be ready to handle similar projects that are certain to arise in the future, Heiman says. And some companies that never had testing tools before now will, he says.

That's proving true for Bell Atlantic. Besides keeping the Baby Bell in busi-

ness, year 2000 testing gives the company, which recently merged with Nynex Corp., a single, comprehensive inventory of all of the varied pieces of its massive network, says Albert Patterson, executive director of the year 2000 program office. □

Date simulation tools are a precursor to "time machines" and logical partitions, analysts say. Time machines — stand-alone test machines with the system clock set forward — are the most desirable if you can afford them, says Dick Heiman, a research manager at IDC. But there are other options, including leasing extra equipment, using a service bureau or finding space and time on your own machines, he says.

Every date simulation tool user we spoke to is conducting some additional type of year 2000 testing. Mass Mutual has a methodology specifically for Project 2000, a logical partition for testing and other testing tools, says Priscilla Mandeachia, director of intercession and compliance on Project 2000. "Testing is probably as difficult as we thought it would be," she adds.

Ohio National Financial Services is conducting tests with its production logical partition, and it uses other testing tools from Compuserve, says Lon Rinehart, systems officer. He warns other companies to plan testing. He says it's

Making reservations

01/01/2000: **WHERE WILL YOU BE?**

D-DAY. GROUND ZERO. BIKINI ATOLL. THE TRENCHES. Those are the terms IS managers use when they talk about The Deadline — Jan. 1, 2000. So we asked where various IS luminaries and vendor executives plan to be that day

BRIAN JAFFE

Director of network and client services at a New York company
Because my office building is in Times Square, we probably won't be able to get near the place until the cleaning crews finish shoveling the confetti away. It's just as well; I'm hoping that we'll be confident enough of our prior testing and preparation that we won't have to go to the office on the first. Personally, I'd like to be able to spend the first day of the new millennium (which, technically, it isn't) in quiet reflection, pondering things a bit more weighty than whether or not all the LAN passwords have just expired or whether the automatic purge of E-mail messages of a certain age just caused the mail server to wipe itself clean.

And I hope that — assuming the public telephone network hasn't shut down — we can dial in and see that systems are up and running. On Sunday, assuming the elevators are working, we'll probably go on-site for a more detailed system check. I

wouldn't be surprised if Jan. 1 and 2 are actually the calm before the storm. Day 3, when the world returns to work (assuming traffic lights and mass transit systems are running), may turn out to be the real ground zero.

At the risk of upsetting the cobblers' barefooted kids, I'll probably find that the one piece of technology I overlooked in my year 2000 testing is my PC at home.

BILL GATES
Chairman and CEO, Microsoft Corp.

I always spend New Year's with my family. As that is also my wedding anniversary, I will no doubt be doing something fun to celebrate with Melinda.

M. LEWIS TEMARES
CIO, University of Miami

Originally, my wife and I thought it would be great to celebrate the millennium's arrival in Vienna. Then I realized I'd have to be back at work sometime in February, and the flights might be screwed up. So now we'll be at home under the blankets after drinking a quart of scotch — with papers, cell phones and land phone off, following the wise principle of the ostrich.

ANDREW FILIPOWSKI
CEO, Platinum Technology, Inc.

I plan to be in bed, cuddling with my beautiful family. We'll sleep the day away in a luxurious do-nothing state, watching the world do what it's gonna do. □

De Jager's objective is to force companies "to do what is right by hanging a sword over their heads," he said in a statement on his World Wide Web site, the Year 2000 Information Center (www.year2000.com).

Here's how it works:

If someone has firsthand knowledge of a system that fails — either an embedded system, software application or

computer platform — and the system manufacturer (which may be his employer) refuses to fix the problem or acknowledge publicly that one exists, he should E-mail that information to de Jager. A submission form is available at de Jager's Web site. Information submitted will be sent (with the identity of the submitter removed) by registered mail to the legal department of the company in question. □

Fallbacks, anyone?

Any former Boy Scouts out there in IS?

Some live by the Scout motto, "Be prepared." But when it comes to the year 2000, many organizations are so sure their systems will be ready that they're not even bothering to prepare for the unexpected in the event something breaks down on or after Jan. 1, 2000.

Contingency planning is a secondary concern. The Yankee Group found in a recent survey of year 2000 project managers at 25 companies.

The survey indicated that only nine of the 25 companies — or 36% — had contingency plans in place as of the third quarter last year. And only seven of 25

— or 28% — have identified third-party processors to run systems that can store data in the event of a modification in their primary information systems.

Capt. Dale, director of management strategies research at Yankee Group, a

6. Bob Dole's age is erroneously listed with only two digits.

5. Sales of

Coca-Cola jump drastically

after original cocaine-

based formula becomes

legal again.

4. Software engineers

point out that since com-

start year 2000 efforts, says Capers Jones, a noted year 2000 consultant.

According to Jones, 1996 was the last year in which a midsize corporation with a software portfolio of a half-million function points could have finished work on time without extraordinary staffing measures. Those include halting all but emergency and required work, assigning up to 85% of staff, running round-the-clock efforts and partnering with consortia or industry groups.

In his forthcoming book, *The Year 2000 Software Problem* (ACM Press/Addison Wesley), Jones says companies whose applications consist mostly of Cobol still can start this year by assigning 50% or more of personnel to year 2000 projects and using automated search engines.

A recent survey by Cap Gemini International portrays the growing staffing shortage. The international researcher/consultancy found that only 20% of 108 companies polled have a year 2000 plan. Yet 70% of those that have begun work have added staff.

Other industry watchers agree that the shortage of candidates to do year 2000 work will get worse. Ann Coffau, who studies year 2000 staffing issues at Giga Research in Norwell, Mass., says the biggest crunch will come when the federal government gets serious about year 2000 fixes.

"Most service providers are going to want that business," Coffau predicts. "And the government will surely take as much help as they can get. Thus, the supply available to private industry will dwindle rapidly."

Many predict that will trigger more poaching by service firms and other IS shops. The bottom line, Coffau says, "Act swiftly."

NO IMMUNITY

Even organizations that got a head start and have adequate staff aren't home free. In fact, year 2000 early-bird pioneers are prime targets for other companies that seek ready-made expertise. Few shops, even in remote areas, are immune.

In Lincoln, Neb., Steve Henderson, the state's deputy administrator of central processing, has noticed head-hunting by a large financial services firm.

"First Data Corp. pretty much drained the IT market in Omaha," Henderson says. "Guess where they have come recruiting? You guessed it."

Millennium mania has been a career boon for many in IS. Take Don Hammon. A 25-year veteran developer, Hammon has worked at a string of glamorous consulting and contracting assignments over the past few years: heart-wave software for Hewlett-Packard Co., network management software at Cabletron, Inc. and U.S. Army Special Forces mission-planning software at

A wealth of fresh and seasoned staffers makes Gottschalk's Jeff Kraft confident the company will meet a planned January 1999 deadline.

tenace," he says. Hammon normally won't suffer the three hours of round-trip commuting needed to travel from his home in Manchester, N.H., to Boston.

"But," he adds, "IT travel to work with cool tools and cool people."

HOPE SPRINGS...

If you're among the late-starters, take heart. Experts say there's still hope for companies that act quickly this year.

First, you can still benefit from others' denial of year

Sanders-Lockheed.

Now, year 2000 has opened the doors to a choice consulting job for Hammon at Fidelity Investments. Hammon is helping to create and leverage year 2000 software tools for the Boston-based mutual fund giant.

"I've led a charmed existence," Hammon says. "I've been able to avoid the worst of the year 2000 problems."

2000 problems. Henderson, who lectures around the country on the year 2000 issue, says he's amazed that many firms still show no awareness or concern for the problem. "People just stare at each other like deer in headlights. It's incredible," he says.

Outsourcing also remains a viable option — for now. Demand for service providers has been lower than expected, Coffau says. Large outsourcing shops are still courting business. Although first- and second-tier project managers are no longer available, a good supply of "worker bees" remains, she says.

Off-shore providers, notably those in India, also can handle work, says Stephanie Moore, a year 2000 specialist at Giga. But unless you've already established a relationship, steer clear, she says.

Farming-out code conversion makes sense for shops such as Henderson's that have too many fixed commitments to alter IS schedules. "We went through all the psychological stages: denial, anger, bargaining, grief in-

fair warning, page 97

puters think it's almost 1900, we technically have to "year" like it's 1999," which, frankly, doesn't seem like much fun.

3. Microsoft declares the year 1900 to be the new standard of the "Catalina" calendar.

4. Japan shows up late for His Second Coming, Mamma & Co. Cobol programmers.

1. Unexpected demand for Cobol programmers results in severe understaffing of fast-food restaurants. ☐

I read the news today, oh boy

Edward Nordens (www.pandora.com), chief economist at investment banker Deutsche Morgan Grenfell in New York, has considered the "worst-case" scenarios of the year 2000. He wrote these hypothetical headlines that we could see in the next three years:

1998

- Economist Sees 40% Odds of Recession on 1/1/00
- Oh, Oh: Fed Audacious Banks That Might Fail in '00

1999

- Credit Card Expires in '00? Leave Home Without It
- Airlines Cancel Many Flights

2000

- Happy New Year! Who Shut Off All the Lights?

COMPUTERWORLD

SPECIAL REPORT YEAR 2000

'FAIR WARNING!'

CONTINUED FROM PAGE 35

to acceptance," he says. "It quickly became clear that our plate was too full."

So in August 1996, the state of Nebraska hired CTA, Inc. in Lincoln to provide 50 consultants to do programming, testing and analysis. A "red flag" clause provides for CTA staffers to remain available until September 2000 for emergency work.

Even though staffing is extra tough in small Midwestern cities, Henderson says, losses in the state's 320-member IS department have been few in the more than two years since year 2000 work began.

"We're working hard to get new people," he says proudly. "We're keeping our head above water."

DO-IT-YOURSELFERS CONTAGIOUS

But the big trend this year is the growing number of companies that have opted to tackle year 2000 fixes in-house. Companies that are lucky enough to have original coders still on staff find that choice especially attractive.

That's true for the city of Honolulu, where Remigos, a 30-year department veteran, has many staffers who've worked there 10 or 20 years. "Everybody out there says they are year 2000 experts," he says. "But there really are no experts. We wrote this code, and we know it better than anyone."

He proudly notes that it costs his staff only about \$1 per line to fix code — 50 cents less than Gartner Group, Inc.'s average cost estimate.

Veteran workers also drive year 2000 efforts at Gottschalk, Inc., a Fresno, Calif.-based regional retailer. "If we didn't have these experienced people, we'd be in a lot of trouble," says Jeff Kratt, director of application development. The chain's 11 in-house programmers "intimately know the applications," he says. They even work in the original Cobol instead of IBM's newer Cobol VSE, he notes.

While others scrape around for talent, Kratt has hired four programmers/analysts this year and may hire two more. Another bonus: fresh IS talent who stayed behind when their larger corporations relocated recently.

IS jobs are less plentiful in Fresno than in Los Angeles or San Francisco, so "people tend to stay put," explains Kratt, who joined the chain in 1971.

The wealth of fresh and seasoned staffers makes Kratt confident the company will meet a planned January 1999 deadline for compliance on IBM VSE legacy systems and a new IBM z/OS. Because Gottschalk programmers began coding four-digit dates in 1980, IS can focus on compliance among third-party vendors, Kratt says.

Still, Kratt isn't taking any chances. Inside his desk drawer hangs a large folder stuffed with promotional materials from Computer Associates International, Inc. and other year 2000 service providers. "Just in case," he says.

At Farmers Alliance Mutual Insurance Co., senior applications programmer John Rickenberg finds himself updating the same policy processing system he helped create 18 years ago for the McPherson, Kan., company. He's helping with an ambitious 18-month project to make legacy insurance systems compliant by November.

Splitting the IBM mainframe into two virtual machines would be tricky enough. But Farmers Alliance recently began the last third of a massive systems replacement project launched in 1990. So in-house teams

work side by side on the oldest and newest systems — an IBM 9141-621 and PMS Series 3 client/server system from Policy Management Systems Corp. in Columbia, S.C.

So far, Rickenberg says, a local year 2000 user group has been a helpful source of information about matters such as embedded programming for fax machines and security systems. "The meetings have been more about sharing and ideas. It has not been cutthroat recruiting. But it could get to that."

OLD CODERS NEVER DIE

More companies are also turning to retirees to fill gaps. Senior Staff, a Silicon Valley company that places retired senior citizens on year 2000 projects, reports business is booming. Other companies are contacting their own retirees.

Remigos may face the tough task of luring back three recently retired programmers. They may be needed to help his 40 programmers finish reviewing and fixing 6 million lines of code by November. "I won't be looking at them unless I get real stuck," he says.

Other companies opt for a mix of do-it-yourself and independent contractors. Take Hyundai Motor America. In 1996, the Fountain Valley, Calif., automaker created a two-and-a-half-year plan to make its IBM multi-processor system year 2000-compliant.

IS director Fred Sipos decided the best approach was a hybrid team of contractors and in-house talent. Sipos and a top application manager led three major development teams. Members included four full-time employees from development, operations and technical support, 20 contractors and part-time contributions from the rest of the 25-member department.

To further ensure that contractors would stay around, Hyundai gave contractors a bonus to stay until the work was done in the second half of 1998. Sipos won't specify the amount or base rate, but he says it started with single-digit hourly bonuses and will increase this year.

Hyundai also held off paying overtime until this year. The reason was to save the extra pay as "an incentive when work became tiring and mundane," Sipos says. IS workers must still show that overtime gets the work done faster, he says. Although some Hyundai workers consider year 2000 work a dead end, Sipos and other IS managers contacted report no real staff opposition.

"I've had no pushback," Sipos says. "People understand that this is just another project."

So far, Hyundai has lost only two contractors to high-

LOOKING WITHIN OR WITHOUT?

Outsourcing fix appears faster for year 2000

Many companies are tackling year 2000 projects themselves, but rough data from 300 projects between 1987 and 1997 suggests that outside providers do a better job. Adequate spending on testing tools and training appears to close that gap quickly on in-house teams.

Year 2000 service providers had —

45% higher productivity levels

45% lower defect levels

30% fewer schedule reductions

Source: Capgem Jones, The Year 2000 Software Project

YOUR TIME TO SHINE

Despite their reputation as a Fast Track to Obsolescence via Old Code City, year 2000 projects offer some interesting opportunities for IS professionals this year. Why should consulting firms show profit from the size of the programming talent?

Among the possibilities:

MONEY. You have heard the tales of mediocre programmers, retirees, even harmless people earning as much as a mediocrity major league baseball player. Return one of those headhunter or consulting firm telephone calls, and that could be you.

POWER. Many companies strapped for year 2000 project managers are drafting junior staffers. "We're not talking about rocket science here," says Fred Sipos, IS director at Hyundai Motor America. With good supervision and knowledge of executables, you're on your way to big bucks and universal admiration.

SMARTS. Boston University and several other schools around the country have developed new curricula around the year 2000. They'll make you a trained millennium-buster in a jiffy.

MORE MONEY. Great-West Life Assurance Co. contracts with its own IS staff for lucrative after-hours year 2000 work. Wonder if that would work at your company? Alternatively, consider asking for a tasty top-hat pay program (<http://www.year2000.com/functools/delivermy-firm.html>).

FREEDOM. Everyone is dying for contractors. If you've thought about jumping to that free lifestyle, now's the time.

er pay rates. The project, which will handle 11 major regional field locations and every U.S. Hyundai dealer, is on track for completion in the second half of this year.

Despite being located in competitive Orange County, Calif., Sipos says Hyundai hasn't had a problem attracting top temporary talent. "Over the last 10 years, we've used a lot of contractors," he says. "It's hard to say this and sound modest, but we have a good shop and a good reputation. We've developed a good pool."

If necessary, Sipos says he could probably find more qualified outsiders, but adds, "We really don't want to find out."

PAYOFF

Whether do-it-yourselfers' sizeable investment of time, training and energy will pay off is far from clear.

Preliminary research shows that in-house staffs are less efficient than hired guns, Jones says. Organizations with adequate staff and budget to learn new testing and debugging tools should do fine, he says.

Plus, companies that fix the problem themselves must pay what can be a big price for delaying, slowing or even killing other IS projects to finish millennium work. Coflow notes, "But if [year 2000 problems don't] get fixed, the other staff is a moot point," he says.

Latecomers and early birds alike would do well to follow Henderson's advice on staffing and millennium work in general. "Just keep on swimming." □

CORPORATE
TECHNICAL
RECRUITING
CONFERENCE

COMPUTERWORLD

May 17-20,
Marriott's
World Center
Orlando, Florida

1-800-

REGIONAL SCOPE

Washington, D.C.

By Jill Vitiello

A RECRUITER'S DAY

What's behind those calls from IS headhunters? Computerworld spent the day shadowing Laura McCarthy, one of Washington's top technical recruiters

TIME: 6 A.M.
When Laura McCarthy's alarm sounds at 6 a.m., she puts on a pot of coffee, quickly reviews

items for the day ahead and jumps on the phone. She leaves voice-mail messages for information systems job candidates and the hiring managers who are her customers.

Then she squeezes in a two-mile "power walk," showers, dresses, grabs her briefcase and is off.

TIME: 8:30 A.M.

During the drive to her office at Source Services in Tysons Corner, Va., McCarthy closes a deal on her car phone. She calls ahead to her assistant, Saba Hasan, to relay the victory. By the time McCarthy spins through the glass double doors of Suite 200 at 8045 Leesburg Pike, she's already put in a couple hours of work.

McCarthy is the top producer for the executive search firm that Washington Business Journal ranked No. 1 in July 1997. In just four years at the company, McCarthy has propelled her career from associate to practice manager. Her boss

and colleagues say she's done it by working 13-hour days, dazzling her customers with detail-oriented, personalized service and winning over the top IS talent in Washington.

TIME: 9:15 A.M.

To stay on top of her game, McCarthy structures her day around her customers' and candidates' schedules. When she arrives at the office, she gives her co-workers feedback on candidates' resumes and then pours the paperwork on Hasan, the team's administrative assistant.

Then McCarthy puts in a multitasking morning. She straps on her headset and begins her "phone blitz," returning calls, negotiating deals, talking with customers and candidates and relaying information.

TIME: NOON

The pace changes but doesn't slow a bit. McCarthy dashes out for a working lunch at a local restaurant with a customer or a candidate. On other days, she skips lunch and spends the time interviewing candidates who have slipped away from their own offices to meet the recruiter. "The hottest IS candidates are those with excellent technical skills, busi-

ness and analytical expertise and functional knowledge," McCarthy says.

TIME: 2 P.M.

McCarthy and her team are back on the phones, returning calls, scheduling appointments, negotiating offers and scribbling notes for Hasan to input in the database.

McCarthy leads the technical recruiting team mentored by Paul Vilella, managing director of Source Services' offices in Washington, Baltimore and Vienna, Va., also known as Tysons Corner. The staff employs approximately 50 recruiters and more than 300 consultants. It is Source Services' leading marketplace.

McCarthy worked as a systems analyst before being lured into the lucrative world of technical head-hunting. She prefers not to discuss her income, which is based primarily on commissions. But Vilella, her boss, concedes that successful recruiters can earn six figures, as can senior-level IS professionals or those with skills that are hard to come by in the metropolitan area.

TIME: 3 P.M.

The chatter of 50 recruiters talking on their phones at once reaches a crescendo. Source Services provides recruiting for permanent and temporary employees in various industries, as well as consulting services and administrative staffing, but the lion's share of the company's business is IS recruiting.

As telecommunications and professional services companies have moved into northern Virginia to dominate the economy, they've sopped up most of the rich IS talent pool in the Washington area market.

Prized prey includes IS professionals with experience in C++, Visual Basic, Smalltalk, the Internet, intranets, Cobol, job control language, client/server skills and large-scale application development.

"It's a candidate-driven market," McCarthy says. "As recruiters, we have to move fast. Some candidates don't stay on the market more than one week. I've placed people in 48 hours."

TIME: 4 P.M.

The evening rush hour provides McCarthy with a few hours to catch up on paperwork and electronic mail.

"We generally can't reach people during drive time, so we spend those hours taking care of internal business or meeting candidates," McCarthy says. At 4:45 p.m., she dashes into a staff meeting.

TIME: 5:30 P.M.

In the quiet lobby, McCarthy greets a job candidate with whom she's scheduled an appointment. Source Services' policy is to meet each candidate before the individual's resume is submitted to IS hiring managers.

TIME: 7 P.M.

While the rest of the world is sitting down to dinner, Source Services recruiters are munching king-size Snickers and Kellogg's Corn Flakes and grabbing another cup of coffee from the huge urn in the galley. They call candidates at their homes to make last-minute preparations for interviews the next day or to conduct confidential conversations that candidates can't manage during the workday at their offices.

TIME: 9 P.M.

"Monday through Friday, I live Source," says McCarthy, who spends her 13-hour days dressed in a business suit, "ready to meet candidates and customers at a moment's notice."

The day finally done, McCarthy removes the telephone headset and closes her day planner. After straightening papers on her desk, she switches off her desk light, grabs her briefcase and heads for the parking lot. □

BEST SOFTWARE, INC.

WASHINGTON, DC CAREERS

Helping train tomorrow's future. Today.

In the world of integrated software solutions, one size may not fit all, but one company just might. CSC. Our SAP practice is small enough to offer speed and scalability, yet large enough to specialize in global IT applications for industries of all types, from health-care to manufacturing to financial services. Our solutions enable clients around the globe to access and share countless volumes of database information. And our seasoned global network of SAP experts is renowned for its project experience, quality assurance methods and ability to form comprehensive implementation teams ideally suited to every assignment.

Just another day at CSC

CSC is currently seeking computer professionals with the self-assurance and presentation skills needed to teach SAP in our Wilmington, DE facility.

SAP Academy Trainers

To qualify, you must have three years' experience with SAP; a background in implementing at least one R/3 module, as well as manufacturing and production process improvement, project management and software engineering methodologies; an ability to develop training contents and case studies; and excellent communications and presentation skills. There will be opportunities to participate in high-level projects throughout North America, as well. German language skills are helpful. Anticipate 10 weeks of per annum travel, mostly to Germany.

Your contributions to our industry leadership will be rewarded with excellent compensation, comprehensive benefits, and ongoing opportunities for professional growth and development. Please mail or fax your resume to: CSC, Attn: Technical Recruiter, PAW0118, 1007 Market Street, M/S D13166, Wilmington, DE 19801. Fax: (302) 774-0395

Y2K knowledge.

As a global systems integrator and innovator, BDM offers you exceptional opportunity to solve the Year 2000 challenges of the Fortune 500. Rapid growth of our SMART/2000™ practice opens the doors to a wide range of challenges nationwide for individuals with expert knowledge of software and system development testing. This is your chance to apply your know-how to first save big business from the perils of the century date change, and then move on to other rewarding projects across our business. And with our recent acquisition by TCI, your long-term potential here is even more exciting. Here are some of the opportunities waiting - check out our Web site for more:

Program Manager (JN01)
10 years in software/systems testing and development with 4 years in technical project leadership. MS Project experience a plus.

Technical Solutions Architect (JN02)
6 years in software development, analysis, design, coding, testing, and implementation with 4 years specializing in COBOL and MVS systems.

Test Consultant (JN04)
12 years in structuring, implementing, and managing software test organizations to include developing required processes and procedures.

Test Lead (JN05)
10-15 years in COBOL, CICS, JCL, and software and system testing.

Senior Test Engineer (JN01)
7+ years in software testing and ability to lead test engineers/analysts in developing test plans and scripts to achieve Y2K compliance. Mainframe, distributed, or stand-alone environments.

Software Test Engineer (JN11)
5+ years in software testing on midrange Unix, VAX, and/or mainframe/RISC systems. Financial systems/applications and knowledge of Year 2000 desired.

BDM

[JN01] - 5+ years in systems/software testing, software development, requirements analysis, test documentation development, IBM mainframe batch and on-line systems running MVS or VAX, or knowledge of client/server systems. Knowledge of Y2K conversion a plus.

Test Analyst (JN07)
5+ years in testing, requirements analysis, and development, demonstrating strong skills in COBOL, CICS, JCL, and IBM mainframe with MVS or VSE/PC and JCL skills a must. Testing experience on IV&V projects preferred.

Systems Programmer (JN04)
6+ years in systems programming with 3+ years focusing on CICS, ISPF, and Control J products. Experience programming in REXX/CL and working with IMS and/or DB2 required. Knowledge of TSO or SCPL a plus.

Database Administrator (JN05)
10+ years in database analysis, design, implementation, maintenance, and performance tuning with at least 1 year in a DBA for IMS, MYKSA, ISPF/PC, TSO, COBOL, PSE-AID, and Abend-AID. Knowledge of DB2, Oracle, SQL, Delphi, PVCS, Rascal, SCPL, EDMS/SQL, and Epsilon a plus.

Positions are in: GA; Bradenton, FL; Columbus, OH; Kansas City, KS; Little Rock, AR; New York, NY; and Philadelphia, PA.

In addition to Year 2000 challenges...

You'll find a wide range of career opportunities at all levels at BDM at our headquarters in Morgan, Washington, DC, and nationwide. Our Web site will give you all the details.

Most positions require a related BS/BA or equivalent experience. All positions offer important benefits including medical, dental, and vision. Our Web site will give you all the details. This includes your know-how and rewards. If please forward your resume to BDM International, Inc., ATTN: Y2K II, 1501 BDM Way, McLean, VA 22102. FAX: (703) 844-3000, e-mail: bdm@bdi.com. BDM is an equal opportunity employer.

COMMENTARY

Damned if you lead, damned if you don't

Allan E. Alter

Just who are you supposed to be? Gen. Patton or Jeeves the butler? IS managers are getting an earful lately about leadership — from consultants, executives and the press — and are

staggered between two contradictory roles: the leaders they're now supposed to be and the service mentality they've always had. IS and line managers are confused, even soured, about IT leadership.

What separates the IT leader from the IT manager? The pundit who stress-driving strong values, inspiring interpersonal skills — and the ability to think and act like a businessperson. That means thinking strategically and understanding your business, markets and customers. Being a leader includes go-get-'em actions: spotting and seizing business opportunities and increasing shareholder value and profits.

That's all important, but the list has a giant blind spot. It leaves out something solid IS professionals feel deep in their bones: that the primary job of IS is to serve the business.

Ask IS managers, from supervisors to

CIOs, and they'll tell you their role is to enable the business to achieve its goals through IT. Good IS organizations have a deeply ingrained service mentality. IS managers may want to participate in business decisions; they sure want line managers to better understand IT. But ultimately, the CEO and top line management must call the tune, and IS must dance to it.

And however much CEOs bellyache about the lack of IS leadership — a common complaint, according to leadership guru Noel Tichy (CW, Dec. 22) — businesspeople still believe IS's No. 1 job is to support the business. If anything,

power over IT decisions is passing to the business side. What were once IT decisions — selecting applications, building infrastructure — have become decisions that CEOs, general managers and even boards of directors are expected to make.

Part of the confusion, I'm convinced, is that leadership experts keep holding up CEOs as examples of leadership — visionary CEOs such as GE's Jack Welch

and Intel's Andy Grove, who have turned around their companies or conquered their markets. But CEOs are the wrong model for the IT leader. If top IS managers were expected to be that kind of business leader, we'd see electronic-commerce initiatives falling under the aegis

of IS instead of line managers. More IS organizations would operate as profit centers. And line managers wouldn't be gaining authority over IT spending.

No wonder, then, that to many IS professionals, leadership remains a vagor,

uncomfortable concept, like a suit that's three sizes too big. If we want IS managers to act like leaders, we must zero in on what it means to lead and serve a business at the same time. I'm not sure anyone has done that, not even the leadership experts. They have a lot to say about the great CEOs, leadership skills and values, but little about acting like a leader when you are in a support role.

Other support functions — finance, human resources and legal departments — suffer the same problem. For all the lip service paid to the importance of a company's human resources, you don't hear of HR directors who are great business leaders. Those best-selling books on business leadership always profile CEOs, entrepreneurs, factory managers and sales whizzes, never CFOs or other support-function heads.

IS needs real leadership, but leadership will remain an empty buzzword to many IS managers, a term that elicits sighs or snickers, until it takes it's service role into account. □

Alter is Computerworld's department editor, Managing. His Internet address is allan_alter@cw.com.

Few escapes for Netscape

David Moschella

As I watch the losses and layoffs at Netscape these days, I can't help but think that the company could have saved itself a lot of pain if it had just stopped banging its head against the wall.

Any way — either Microsoft's or that of its so-called enterprise friends at IBM, Novell, Sun and so on. Unfortunately, the pain seems likely to continue; neither Netscape nor the walls are moving.

I've been saying since summer 1996 that there were three ways for Netscape to remain a software industry leader:

1. Sustain a significant product edge either through its own efforts or a Microsoft slip-up.
2. Find a rich enterprise partner willing to match Microsoft's freeware strategy and marketing blitz.
3. Get the U.S. government to force Microsoft to charge a reasonable price for Internet Explorer.

Because a major Microsoft product stumble was never more than a long shot, Netscape's real strategic dilemma has always been whether to take on Redmond or the enterprise software crowd.

Unfortunately, it has tried to do both, protected only by its idealized banner of "standards."

It didn't have to be this way. If Netscape wanted to fight Microsoft, it needed to make its own Web browsers and servers the Internet software of choice for IBM, Sun, Oracle, Novell, Apple, Computer Associates and anyone else who feared Redmond's rising enterprise power. If it wanted to fight for the enterprise, it should have immediately made its browser free. Impossibly, Netscape continues with both the Microsoft and enterprise campaigns. Thus, while Microsoft grinds away from below, hope for

serious enterprise software cooperation has pretty much disintegrated. At IBM, Lotus Notes and Domino have always come first, second and third. Similarly, back when it might have mattered, Netscape turned up its nose at a struggling Novell. Apparently worried that too close an association with Microsoft's most recent roadkill might tarnish its high-flying image.

Then, brilliantly, Microsoft bought off Apple. That left only the Unix camp leaders, Sun and Oracle, and a distant CA; those three could do nothing to help Netscape on the desktop. Sadly, as the walls close in, Netscape has mostly dug in its heels, debating whether browsers are important but certainly wouldn't want to count on it. □

reality is today's enterprise intranet competition is much more like trench warfare through a long Russian winter.

Netscape can only hope that prosperity lies with Choice No. 3. And unless the feds quickly and dramatically order Microsoft to begin charging for Explorer (and perhaps even pay damages), Netscape's position will likely continue to erode. No wonder Microsoft is now reversing course, trying to soften its bullying and disrespectful attitude toward the U.S. Department of Justice.

In Shakespeare's *Hamlet*, what finally doomed Ophelia was that during her most desperate hour, her family and friends largely turned away, embarrassed by both her open suffering and the guilt of their own complicity. At times, things seem much the same in Mountain View; when support and alliances mattered most, they proved to be an illusion. Now Netscape's best chance is a judicial reprieve. I hope it comes through soon, but I sure wouldn't want to count on it. □

Dispatches & rages from the fringes of the tech world

News to ponder

Edison International, parent company of Southern California Edison, had a float with a twist in this year's Rose Parade. The Robot Dog float had solar-powered cellular phones that sent live camera images to Edison's Web site (www.edison.com) for public viewing. The cellular data transfers worked fine, but as soon as TV announcers mentioned the site, it was swamped by visitors, an official said.

British vendor Dannerre has launched the Backer 32 backup system in the U.S. It lets PC users store 4G bytes of data on a standard videotape, using a VCR as the backup device. Backer 32 costs \$69 to \$89. "It's so obvious, it's been easy to overlook. Almost every home has a tape storage device, the VCR," a spokeswoman said. Backer 32 has a transfer rate of 9M byte/ min. "Since most VCRs are built to higher specifications than the average tape backup unit, they are dependable storage devices," she said.

VIRTUAL TRAFFIC COPTER

Cable TV viewers soon will be able to check real-time traffic reports before the morning commute. Traffic Check, a service of digital mapping company Etak in Menlo Park, Calif., and Houston-based Metro Networks, is the first automated traffic report for local TV. Metro reporters log the traffic problems in to a database. A server then generates broadcast-quality digital maps that are color-coded to indicate severity.

supercomputer

Environmental researchers at Oak Ridge National Laboratory in Oak Ridge, Tenn., needed a powerful supercomputer to analyze billions of bits of landscape data and produce a map of U.S. soil characteristics. But the laboratory's Paragon supercomputer was already booked solid for other tasks. So researchers Forrest Hoffman (left) and Bill Margrove cobbled together a parallel processing supercomputer using cast-off 486-based PCs. The populist system, with about 32 nodes, has successfully run programs that ordinarily run on the high-class Paragon. In the future, this sort of beat-up Chevy supercomputer could be used to test and debug new programs before they are run on Cadillac supercomputers.

Inside Lines

There wasn't a bad thing after all

No more NEC laptops for Theory Ullman. The comedian, who spoke for NEC last year and received a free machine as part of her payment, had the computer "taken right off my desk," she said. Ullman now uses an Apple PowerBook. "I suppose I should be compatible with the rest of my staff, but I love the Macintosh. Pizzano and all that," she explained, referring to one of the stars of Apple's new "Think different" advertisements.

Lights-out operations

Early last week, millions of Quebec residents still struggled with power outages, while businesses in Montreal were asked to stay closed to help preserve the fragile power grid that the province's power utility, Hydro-Quebec, was trying to rebuild. But more than a few people were asked that the huge, business signs above Hydro-Quebec's headquarters stayed lit for days while others stayed in the dark. After a public outcry, Hydro-Quebec officials said the signs off until the end of the crisis.

The best Christmas present of all

Pred Liggins, founder of Lake Construction, in Charlotte, Vt., received his favorite Christmas present in the mail at just the right time. An unreturnable power supply (UPS) from American Power Conversion, in West Kingston, R.I., arrived the day before he lost power in his barn. He was in the dark for more than two hours, but his PC and company files remained available the whole time, he said.

Microsoft's helping hand?

O'Reilly & Associates best Microsoft to the punch in the Windows NT Web server market, drawing the attention of the mighty software maker. "They first were telling us, 'Oh, wow. This is so great. Somebody's doing a Web server on NT. We'll back you. We're going to make you rich and famous,'" recalls Tim O'Reilly, owner of the company. A few months later? "They said, 'Oops, just kidding. We want to do it ourselves.'" O'Reilly laughed.

Channel change

Cabletron Systems will use the channel network it acquired as part of its purchase of Digital Equipment's networking business to move off its direct sales model. Cabletron will continue to provide direct sales and support for its top 600 accounts, but other customers will be offered a channel option. Look for a formal announcement this week. Users interviewed by Computerworld were split as to whether they would stay with direct sales and support.

All I need is a Myracle

Ever notice that the names of some people are nice matches for what they do in life? Such as NASCAR driver Lake Speed or former professional hockey player, now Buffalo Sabres' coach, Lindy Ruff. Millennium punsters can try this one: Jerry Myracle. His job: director of American Express Technologies' Year 2000 Project Office.

Kicking off his speech at last week's Securities Industry Association year 2000 conference, Forrester Research CEO George Colony shared a tale of a fiftysomething Cabot programmer who got squeezed out of a job in the early 1990s, only to reinvent himself as a millionaire consultant in the mid-'90s. After doing some work on the year 2000 problem, the programmer asked a cryogenics company to freeze his body until after the millennium. Next thing he knows, the programmer wakes up and it's 8,000 years into the future — thanks to a date-related problem with the cryogenics system. Suddenly, the prime minister of Earth, who bears a strong resemblance to Bill Gates, appears on a digital screen. "Why am I here?" asks the programmer. "Well, the year 10,000 is only two years away," the prime minister says, "and we understand you know something about Cabot." If you have a story to share, or even a news tip, send it to news editor Patricia Keefe at (508) 830-8183 or patricia_keefe@cw.com.
